Document Usage Notes

- Easy Mobile Pro and Basic versions share this same document
- Features that are only available on Pro version will be marked accordingly in the corresponding chapters

Introduction

Easy Mobile is our attempt to create a many-in-one Unity package that greatly simplifies the implementation of de facto standard features of mobile games including advertising, in-app purchasing, game services, notifications and native mobile functionalities. It does so by providing a friendly editor for setting up and managing things, and a cross-platform API which allows you to accomplish most tasks with only one line of code. It also leverages official plugins wherever possible, e.g. [Google Play Games plugin for Unity](#), to ensure reliability and compatibility without reinventing the wheel.

Easy Mobile supports two major mobile platforms: iOS and Android.

This plugin is currently divided into the following modules:

- **Advertising**

- Compatible with AdColony, AdMob, Chartboost, Heyzap and Unity Ads; even more with AdMob or Heyzap mediation
- Automatic ad loading
- Allows using multiple ad networks in one game
- Allows different ad configurations for different platforms

- **Game Services**

- Leverages Unity's GameCenterPlatform on iOS and Google Play Games plugin on Android
- Leaderboards and achievements
- Saved Games (Pro version only)

- **GIF (Pro version only)**

- Records screen, plays recorded clips and exports GIF images
- High-performance, mobile-friendly GIF encoder
- Giphy upload API for sharing GIF to social networks

- **In-App Purchasing**

- Leverages Unity In-App Purchasing service
- Custom editor for easy management of product catalog
- Receipt validation

- **Sharing**

- Shares texts, URLs and images using the native sharing functionality

- **Native APIs**

- Access to mobile native UI elements including alerts and (Android) toasts
- More native functionalities will be added soon

- **Notifications**

- Fully-customizable local notifications
- Compatible with [OneSignal](#), a free and popular service for push notifications
- Supports notification channels and channel groups on Android O and higher

- **Utilities**

- Store Review: provides an effective way to ask for reviews and ratings using the system-provided rating prompt of iOS (10.3+) and a native, highly customizable popup on Android

The modular approach allows you to enable only the modules that you use, which helps avoid redundancies and potential conflicts with existing code that does the same job in your project, if any.

Easy Mobile Versions

Easy Mobile comes in 2 different versions: Basic and Pro. Easy Mobile Basic is the lower-price version which contains most of the core features of the plugin, except a few advanced functionalities such as GIF and Saved Games. The Pro version is the premium one and have all features available. This document is shared between both versions, and Pro-only features will be marked accordingly in the corresponding chapters.

Below is a feature-comparison table of the Basic and Pro versions of Easy Mobile.

FEATURES	BASIC	PRO
Advertising	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Compatible with AdColony, AdMob, Chartboost, Heyzap & UnityAds <i>*more networks can be used via AdMob or Heyzap mediation</i>	●	●
Multiple ad formats: banner, interstitial, rewarded	●	●
One unified API for all ad networks	●	●
Automatic ad loading	●	●
Showing ads from multiple networks in one app	●	●
Built-in Remove-Ads function	●	●
Game Services	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Compatible with Game Center (iOS) & Play Game Services (Android)	●	●
Automatic login/initialization	●	●
Leaderboards	●	●
Achievements	●	●
Saved Games <ul style="list-style-type: none"> • Using iCloud (iOS) and Google Drive (Android) • With automatic conflict resolution 		●
GIF	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Low-overhead screen recorder		●
Built-in players for recorded clip playback		●
Mobile-friendly GIF encoder		●
Full control on GIF generation: sizes, length, quality, frame-rate, etc.		●
Advanced color quantization for high quality GIF images		●
Giphy upload API		●
In-App Purchasing	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Multiple stores supported: App Store, Google Play, Amazon Apps, etc.	●	●
Multiple product types: consumable, non-consumable, subscription	●	●
Custom editor for easy management of product catalog	●	●
Auto initialization	●	●
Local receipt validation	●	●
Native APIs	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Native UI <ul style="list-style-type: none"> • Alerts (one, two and three buttons popups) • Toasts (Android only) 	●	●
Notifications	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Fully-customizable local notifications	●	●
Android 8.0 notification channel & channel group support	●	●
Push notifications (compatible with OneSignal)	●	●
Sharing	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Sharing of images, texts and URLs via native sharing functionality	●	●
Built-in screenshot capturing methods	●	●
Utilities	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Store Review <ul style="list-style-type: none"> • System-provided rating prompt (iOS 10.3 and higher) • Custom native rating popup (Android, iOS lower than 10.3) 	●	●
Visual Scripting Support	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Compatible with Playmaker (100+ custom actions)		●

Requirements

- Unity 5.3.0 or above.

Using Easy Mobile

Using Easy Mobile involves 3 steps:

- Configure the plugin using the built-in Settings interface
- Make sure an instance of the EasyMobile prefab is added to your first scene
- Make appropriate API calls from script

Configuration

After importing Easy Mobile, there will be a new menu added at *Window > Easy Mobile* from which you can access the Settings interface and configure various modules of the plugin.

The Settings interface is the only place you go to configure the plugin. Here you can enable or disable modules, provide ads credentials, add leaderboards, create a product catalog, etc.

All these settings are stored in the `EM_Settings` object, which is a `ScriptableObject` created automatically after importing the plugin and is located at `Assets/EasyMobile/Resources`. You can also access this `EM_Settings` class from script and via its properties accessing each module settings in runtime.

EasyMobile Prefab

For the plugin to function properly it is required that an instance of the EasyMobile prefab is added to one of the game scenes. The prefab is automatically created when importing the plugin and is located at its root folder. It will handle tasks like initialization and automatic ad loading.

It is advisable to add the EasyMobile prefab to the first scene in your game so that the modules have time to initialize before you actually use them. Likewise, this will allow the automatic ad loading process to start soon and the ads will be more likely available when needed.

To add an EasyMobile instance to your scene, simply right-click in the Hierarchy window to open the context menu (as you would when creating Unity built-in objects), then select *Easy Mobile > EasyMobile Instance*. Alternatively, you can just drag the prefab to the Hierarchy window, only make sure to make it a root-level object (parentless).

If you're using Unity 5.6 or newer, you'll get a warning if you start an iOS or Android build without having added the EasyMobile instance to one of your scenes.

Scripting

Easy Mobile API is written in C# and is put under the namespace `EasyMobile`. Therefore, you need to add the following statement to the top of your script in order to access its API methods.

```
using EasyMobile;
```

Easy Mobile's API is cross-platform so you can use the same codebase for both iOS and Android.

Testing Using the Demo App

Easy Mobile comes with a demo app that you can use to quickly test each module's operation after configuring. The demo app is contained in folder `Assets/EasyMobile/Demo`. To use the demo app, you need to add an instance of the `EasyMobile` prefab to the `DemoHome` scene located in the `Assets/EasyMobile/Demo/Scenes` folder.

Using PlayMaker Actions

Starting from version 1.1.3, Easy Mobile is officially compatible with PlayMaker, with nearly 100 custom actions ready to be used. You can install these actions from menu *Window > Easy Mobile > Install PlayMaker Actions*.

Easy Mobile's Demo App for PlayMaker

When installing the PlayMaker actions, a demo app will also be imported at *Assets/EasyMobile/Demo/PlayMakerDemo*. This demo is a copy of our main demo app, rebuilt using PlayMaker actions instead of C# scripts. You can take it as an example to get an insight into how Easy Mobile's PlayMaker actions can be used in practice.

Apart from installing PlayMaker (obviously), you need to do a few more setup steps as described below, before running this demo app.

Installing the Unity UI add-on for PlayMaker

Our PlayMaker demo app uses the Unity UI system, so you need to install [the Unity UI add-on for PlayMaker](#).

Adding the EasyMobile Prefab Instance

Similar to the main demo app discussed above, you need to add an instance of the Easy Mobile prefab to the *DemoHome_PlayMaker* scene located in the *Assets/EasyMobile/Demo/PlayMakerDemo* folder.

Importing PlayMakerGlobals

The demo app uses global PlayMaker variables and events, so you need to import them before running the app.

If your project is new and doesn't have any PlayMakerGlobals (in the *Assets/PlayMaker/Resources* folder), simply copy our Globals over by these steps:

- Double-click the *PlayMakerGlobals.unitypackage* in the *Assets/EasyMobile/Demo/PlayMakerDemo* folder.
- Locate the newly created file *PlayMakerGlobals_EXPORTED.asset* right under the *Assets* folder.
- Rename the file to *PlayMakerGlobals.asset* and move it to the *Assets/PlayMaker/Resources* folder.

If your project already contains some global PlayMaker variables and events (a *PlayMakerGlobals.asset* file exists in the folder *Assets/PlayMaker/Resources*), you can merge these with our demo's Globals using PlayMaker's Import Globals tool: go to menu

PlayMaker > Tools > Import Globals and select the PlayMakerGlobals.unitypackage in the Assets/EasyMobile/Demo/PlayMakerDemo folder.

Advertising

The Advertising module helps you quickly setup and show ads in your games. Here're some highlights of this module:

- **Supports multiple networks**
 - This module allows showing ads from most of top ad networks: AdColony, AdMob, Chartboost, Heyzap and Unity Ads
 - Even more networks can be used via AdMob or Heyzap mediation
- **Using multiple networks in one game**
 - It's possible to use multiple ad networks at the same time, e.g. use AdMob for banner ads, while using Chartboost for interstitial ads and Unity Ads for rewarded ads
 - Different configurations for different platforms are allowed, e.g. use Unity Ads for rewarded ads on Android, while using Chartboost for that type of ads on iOS
- **Automatic ad loading**
 - Ads will be fetched automatically in the background; new ad will be loaded if the last one was shown

The table below summarizes the ad types supported by Easy Mobile for each ad network.

Ad Network	Banner Ad	Interstitial Ad	Rewarded Ad	Mediation
AdColony		●	●	
AdMob	●	●	●	●
Chartboost		●	●	
Heyzap	●	●	●	●
Unity Ads		●	●	

Module Configuration

To use the Advertising module you must first enable it. Go to *Window > Easy Mobile > Settings*, select the Advertising tab, then click the right-hand side toggle to enable and start configuring the module.

Setup Ad Networks

The Advertising module works with top mobile ad networks: AdMob, Chartboost, Heyzap and Unity Ads. To show ads from a certain network you need to import its plugin (or enable the corresponding Unity service in case of Unity Ads). Easy Mobile will automatically check for the availability of these plugins and prompt you to download and import them if needed.

Only import plugins for the ad networks you use to not increase the build size unnecessarily.

A Note on using Heyzap

Heyzap can serve ads from multiple other networks thanks to its mediation feature. To do so it requires 3rd-party SDKs to be imported together with its own plugin. If you use Heyzap, you should not import the standalone-plugins of other networks (AdColony, AdMob, Chartboost, etc.), to avoid potential conflicts. Instead, use them as mediated networks under Heyzap and import their corresponding packages provided at the Heyzap download page.

AdColony

Create AdColony Apps and Zone Ids

To show ads from AdColony you need to create apps and ad zones in its clients portal. To access the clients portal, create an account and login to [AdColony page](#).

In the clients portal, select **MONETIZATION** tab, then select the **Apps** sub-tab and click the **Setup New App** button.

The screenshot shows the AdColony client portal interface. At the top, there are tabs: HOME, MONETIZATION (which is selected), ADVERTISING, and SUPPORT. Below the tabs, there's a navigation bar with links for Apps, App Reports, and Download SDK. A search bar labeled 'Search Filter' is present. Underneath, there are fields for 'Search by App Name' and 'Platform' (set to 'All'). On the right, there's a 'Date Range' dropdown set to 'This Month' and a green button labeled '+ Setup New App' which is highlighted with a red box.

In the opened page enter the required information for your new app, e.g. app name, platform and location. You can also select the ad types that you would like to allow in your app. Hit **Create** when you're done, your app will be created and you'll be redirected back to the **Apps** page. Select your newly created app to reveal its information, which looks similar to the picture below. Note the **AdColony App ID** as we will use it later.

The screenshot shows the 'Basic App Information' section of the AdColony app edit page for 'Easy Mobile Demo (Unreleased)'. The app details are as follows:

App Name	Easy Mobile Demo (Unreleased)
Platform	
Status	3 Zones
Price	Free
Categories	Casual,
AdColony App ID	app770e6afa48

The 'AdColony App ID' field is highlighted with a red box.

Now your app is ready, the next step is to create ad zones for it. Click the **Setup New Ad Zone** at the bottom of the app edit page to create a new ad zone.

In the **Integration** section, give your ad zone a name, optional notes and set its as active. Note the **Zone ID** as we'll use it later.

The Zone ID will appear once you save your new ad zone.

Integration

Zone is active?

Yes No

Zone ID: **vz9494457a075**

Name your ad zone

rewarded-ad

Special notes on this zone

Dedicated zone for rewarded ads

In the **Creative Type** section, select the **Video** option.

Creative Type

WARNING: Creative type for a zone cannot be change once the zone is created

Video

Display (In Testing)

In the **Zone Type** section, select **Preroll/Interstitial** if you want to use this zone for interstitial video ads. Otherwise, select **Value Exchange/V4VC** to use it for rewarded ads.

Zone Type

Preroll/Interstitial ?

Value Exchange/V4VC ?

V4VC Secret Key: **v4vc725c8f3386**

Client Side Only?

Yes No

Virtual Currency Name

Credits

Daily Max Videos per User

20

Must be greater than 0

Reward Amount

1

Must be greater than 0

In the **Options** section, you can set a daily cap or a session cap to limit the number of ads served to a user per day or per session, respectively. In the **Development** section, you can choose to show test ads only (for debug purpose), don't forget to disable this option when your app is released.

Options

Daily play cap	Session play cap
<input type="text" value="0"/> (0 for no limit)	<input type="text" value="0"/> (0 for no limit)
<input type="checkbox"/> Enable Ad Skipping After	<input type="text" value="0"/> Seconds (This setting allows users to skip ads after a delay.) ?
<input type="checkbox"/> Override App-Level Settings	

Development

Show test ads only (for dev or debug)? Yes No

Now your new ad zone is fully configured, click the **Save** button to save it. Repeat the process to create other ad zones to suit your needs. Typically, you'd want to have 2 ad zones, one for interstitial ads and one for rewarded ads. If you're targeting multiple platforms, create a new app for each platform, and for each app create the necessary ad zones.

Import AdColony Plugin

To have your Unity app work with AdColony you need to import the [AdColony plugin for Unity](#). In the **ADCOLONY SETUP** section of the Advertising module, click the *Download AdColony Plugin* button to open the download page. Download the plugin and import it to your project.

Configure AdColony

After importing the AdColony plugin, the **ADCOLONY SETUP** section will be updated as below.

ADCOLONY SETUP

 AdColony plugin was imported.

[Download AdColony Plugin](#)

AdColony IDs

▼ iOS

App Id	[Redacted]
Interstitial Ad Id	[Redacted]
Rewarded Ad Id	[Redacted]

▼ Android

App Id	[Redacted]
Interstitial Ad Id	[Redacted]
Rewarded Ad Id	[Redacted]

Ad Settings

Show Rewarded Ad PrePopup

Show Rewarded Ad PostPopup

Ad Orientation

- *[iOS] AdColony Ids:* enter the app ID and zone IDs created in the AdColony clients portal for the iOS app
- *[Android] AdColony Ids:* enter the app ID and zone IDs for the Android app
- *Show Rewarded Ad PrePopup:* show the AdColony's default popup before a rewarded video starts
- *Show Rewarded Ad PostPopup:* show the AdColony's default popup after a rewarded video has finished
- *Ad Orientation:* select the orientation for the ads to match your app settings

AdMob

Import AdMob Plugin

To show ads from AdMob you need to import the [Google Mobile Ads plugin](#). In the **ADMOB SETUP** section, click the *Download Google Mobile Ads Plugin* button to open the download page. Download the plugin and import it to your project.

Configure AdMob

Enter AdMob IDs

After importing Google Mobile Ads plugin, you can now enter the required IDs for each platform.

To find the App ID for your app follow the instructions [here](#).

Note that you only need to provide the IDs of the ad units you want to use, e.g. if you only use AdMob banner ad you can leave the interstitial ad and rewarded ad IDs empty.

If you're not familiar with AdMob, follow the instructions [here](#) to create ad units and obtain the ad IDs; an ad ID should have the form of ca-app-pub-0664570763252260xxxxxxxxxxxx.

Using AdMob Test Mode

To enable AdMob's test mode, simply check the *Enable Test Mode* option and enter the IDs of your testing devices into the *Test Device Ids* array.

You can find the ID of your test device by building and running the Easy Mobile demo app on that device. Remember to add the EasyMobile prefab to the DemoHome scene before starting the build.

Android device ID

- In Unity, build the Easy Mobile demo app for Android platform
- Install and run the demo app on your testing device
- Open Terminal (Mac) or Cmd (Windows) and type in

```
adb logcat -s Ads
```

(if you're on Windows, you may need to [add the Android SDK path to the Windows System PATH](#))

- In the demo app, select ADVERTISING and then click the SHOW BANNER AD button
- Observe the output logcat in the Terminal/Cmd and locate a line similar to the one in the following image, the value between the double quotes is your device ID

```
I Ads      : Starting ad request.  
I Ads      : Use AdRequest.Builder.addTestDevice("219436D312DE332072794[REDACTED]") to get test ads on this device.
```

iOS device ID

- In Unity, build the Easy Mobile demo app for iOS platform
- Open the generated project in Xcode and run it on your testing device
- Type 'google' into the filter box of the Xcode Console, and find your device ID between the double quotes as highlighted in the following image

[iOS] CocoaPods Requirement

The Google Mobile Ads plugin for Unity employs CocoaPods to automatically import the necessary frameworks to the generated Xcode project when an iOS build is performed in Unity. Therefore you need to install CocoaPods to your Mac: please go to

<https://cocoapods.org/> for install instructions, as well as for more information about CocoaPods. Note that you only need to install CocoaPods, everything else will be done automatically by the Google Mobile Ads plugin.

When building for iOS in Unity, CocoaPods will automatically create an Xcode workspace (with .xcworkspace extension) in the generated Xcode project. You should always open this workspace instead of the normal project file (with .xcodeproj extension).

Chartboost

Import Chartboost Plugin

To show ads from Chartboost you need to import the [Chartboost plugin for Unity](#). In the **CHARTBOOST SETUP** section, click the *Download Chartboost Plugin* button to open the download page. Download the plugin and import it to your project.

Configure Chartboost

After importing Chartboost plugin, the **CHARTBOOST SETUP** section will be updated as below.

Click the *Setup Chartboost* button to open Chartboost' s settings tool.

Provide the App IDs and App Signatures for your targeted platforms. Remember to click the *Setup Android SDK* button if you're building for Android.

To obtain the App Id and App Signature you need to add your app to the Chartboost dashboard. If you're not familiar with the process please follow the instructions [here](#).

After adding the app, go to APP SETTINGS > Basic Settings to find its App ID and App Signature.

READ_PHONE_STATE permission on Android

The Chartboost SDK includes the READ_PHONE_STATE permission on Android, to "handle video playback when interrupted by a call", as stated in its manifest. READ_PHONE_STATE permission requires your app to have a privacy policy when uploaded to Google Play. Since this permission is not mandatory to run the Chartboost SDK, you can safely remove it if you are not ready to provide the required privacy policy. To remove the permission, open the `AndroidManifest.xml` file located at `Assets/Plugins/Android/ChartboostSDK` folder, then delete the corresponding line (or comment it out as below).

```
<!-- Exclude the READ_PHONE_STATE permission because it requires a privacy policy -->
<!-- <uses-permission android:name="android.permission.android.permission.READ_PHONE_S
TATE" /> -->
```

Testing Notes

Please note that to show ads from Chartboost you need to either create a publishing campaign or enable the Test Mode for your app.

- To create a publishing campaign follow the instructions [here](#)
- To enable Test Mode follow the instruction [here](#)

Heyzap

As mentioned earlier, if you use Heyzap's mediation with other networks (AdColony, AdMob, Chartboost, etc.), you should not import the standalone-plugins of those networks, to avoid potential conflicts. Instead, import their corresponding packages provided at the Heyzap download page.

Import Heyzap Plugin

To show ads from Heyzap you need to import the [Heyzap plugin for Unity](#). In the **HEYZAP SETUP** section, click the *Download Heyzap Plugin* button to open the download page.

In the download page select your preferred networks to use with Heyzap mediation. The Heyzap dynamic documentation will update automatically to reflect your selections.

Network Selection:

Follow the instructions provided by Heyzap to download and import its plugin as well as other required 3rd-party plugins. Also go through the **Integration Notes** section below to avoid problems that may occur during the integration of 3rd-party networks.

If you haven't already, use Heyzap's [Integration Wizard](#) to setup the 3rd-party networks to use with mediation.

Configure Heyzap

After importing Heyzap plugin, the **HEYZAP SETUP** section will be updated as below. You can now enter your publisher Id to the *Heyzap Publisher Id* field.

Heyzap Mediation Test Suite

The Heyzap plugin comes with a convenient Test Suite that you can use to test each of the networks you selected for mediation. To use this Test Suite, simply check the *Show Heyzap Test Suite* option in the **HEYZAP SETUP** section.

Below is the Test Suite interface on iOS.

Integration Notes

This section discusses some notes that you should take when using Heyzap mediation with various other networks.

Facebook Audience Network (Android-specific)

The Facebook Audience Network package contains an *android-support-v4.jar* file under *Assets/Plugins/Android* folder. If your project already contains a *support-v4-xx.x.x.aar* file under that same folder, feel free to remove (or exclude it when importing) the jar file or it will cause the "Unable to convert dex..." error when building due to duplicate libraries.

AppLovin (Android-specific)

As instructed in the Heyzap documentation, you need to add the AppLovin SDK key to its *AndroidManifest.xml* file located at *Assets/Plugins/Android/AppLovin* folder. Simply add the following line inside the *<application>* tag in the manifest, replacing *YOUR_SDK_KEY* with your actual AppLovin SDK key.

```
<meta-data android:name="applovin.sdk.key" android:value="YOUR_SDK_KEY"/>
```

This manifest also includes the *READ_PHONE_STATE* permission, which requires your app to have a privacy policy when uploaded to Google Play. This permission is not mandatory to run the AppLovin SDK, therefore you can safely remove it if you are not ready to provide the required privacy policy. To remove the permission, simply delete the corresponding line from the manifest or comment it out as below.

```
<!-- Exclude the READ_PHONE_STATE permission because it requires a privacy policy -->
<!-- <uses-permission android:name="android.permission.READ_PHONE_STATE" /> -->
```

The minSdkVersion Problem (Android-specific)

The current Heyzap SDK requires a *minSdkVersion* of 10, while some other 3rd-party plugins may require a version of 11 or above. If you get a build error including this line

```
Unable to merge android manifests...
```

and this line

```
Main manifest has <uses-sdk android:minSdkVersion='x'> but library uses minSdkVersion='y'
```

where $x < y$, it means you need to increase the `minSdkVersion` of the app. To do so go to *Edit > Project Settings > Player*, then select the *Android settings* tab and increase its *Minimum API Level* to the required one (which is ' y ' in this example).

Unity Ads

Enable Unity Ads Service

To use Unity Ads service, you must first [set up your project for Unity Services](#).

To show ads from Unity Ads you need to enable the corresponding service. Easy Mobile will automatically check for the service's availability and warn you to enable it if needed. Below is the **UNITY ADS SETUP** section when Unity Ads is not enabled.

To enable Unity Ads switch the platform to iOS or Android, then go to *Window > Services* and select the Ads tab.

In the opened configuration window, click the toggle at the right-hand side to enable Unity Ads service. You may need to answer a few questions about your game.

The **UNITY ADS SETUP** section will be updated after Unity Ads has been enabled.

Testing Notes

It is advisable to enable the test mode of Unity Ads during development. This will ensure there's always an ad returned whenever requested. To enable test mode simple check the *Enable test mode* option within the Ads configuration window.

Remember to disable this test mode when creating your release build.

Automatic Ad Loading

Automatic ad loading is a feature of the Advertising module. It regularly checks for the availability of default ads, and performs loading if needed, to make sure that ads are always ready when they need to be shown. You can configure this feature in the **AUTO AD-LOADING CONFIG** section.

Default ads are ads loaded from default networks, see Default Ad Networks section.

AUTO AD-LOADING CONFIG	
Auto-Load Default Ads	<input checked="" type="checkbox"/>
Ad Checking Interval	10
Ad Loading Interval	20

- *Auto-Load Default Ads*: uncheck this to disable automatic ad loading feature, you can load ads manually from script, see **Scripting** section for instructions on this
- *Ad Checking Interval*: change this value to determine how frequently the module should perform ads availability check, the smaller the more frequently
- *Ad Loading Interval*: the minimum time between two ad loading requests

Default Ad Networks

You can select default ad networks for each platform in the **DEFAULT AD NETWORKS** section. You can have different networks for different ad types and different selections for different platforms. If you don't want to use a certain type of ad, simply set its network to **None**.

DEFAULT AD NETWORKS

▼ [iOS] Default Ad Networks

Banner Ad Network	Ad Mob
Interstitial Ad Network	Chartboost
Rewarded Ad Network	Unity Ads

▼ [Android] Default Ad Networks

Banner Ad Network	Ad Mob
Interstitial Ad Network	Ad Mob
Rewarded Ad Network	Unity Ads

⚠ Default ad network AdMob has no SDK. Please import its plugin.

⚠ Default ad network Chartboost has no SDK. Please import its plugin.

⚠ Default ad network UnityAds has no SDK. Please import its plugin.

Pay attention to the warnings and import the required plugins if you haven't already.

Scripting

This section provides a guide to work with the Advertising API using the default ad networks configured in the module settings.

You can access the Advertising module API via the Advertising class under the EasyMobile namespace.

Banner Ads

To show a banner ad you need to specify its position using the *BannerAdPosition* enum. The banner will be displayed once it is loaded.

```
// Show banner ad
Advertising.ShowBannerAd(BannerAdPosition.Bottom);
```

To hide the current banner ad (it can be shown again later):

```
// Hide banner ad
Advertising.HideBannerAd();
```

To destroy the current banner ad (a new one will be created on the next banner ad showing):

```
// Destroy banner ad
Advertising.DestroyBannerAd();
```

Interstitial Ads

The method to show an interstitial ad requires it to be already loaded. Therefore you should check for the ad's availability before showing it.

```
// Check if interstitial ad is ready
bool isReady = Advertising.IsInterstitialAdReady();

// Show it if it's ready
if (isReady)
{
    Advertising.ShowInterstitialAd();
}
```

An *InterstitialAdCompleted* event will be fired whenever an interstitial ad is closed. You can listen to this event to take appropriate actions, e.g. resume the game.

```
// Subscribe to the event
void OnEnable()
{
    Advertising.InterstitialAdCompleted += InterstitialAdCompletedHandler;
}

// The event handler
void InterstitialAdCompletedHandler(InterstitialAdNetwork network, AdLocation location
)
{
    Debug.Log("Interstitial ad has been closed.");
}

// Unsubscribe
void OnDisable()
{
    Advertising.InterstitialAdCompleted -= InterstitialAdCompletedHandler;
}
```

Rewarded Ads

The method to show a rewarded ad requires it to be already loaded. Therefore you should check for the ad's availability before showing it.

```
// Check if rewarded ad is ready
bool isReady = Advertising.IsRewardedAdReady();

// Show it if it's ready
if (isReady)
{
    Advertising.ShowRewardedAd();
}
```

A *RewardedAdCompleted* event will be fired whenever a rewarded ad has completed. You should listen to this event to reward the user for watching the ad. Otherwise, a *RewardedAdSkipped* event will be fired if the ad is skipped before finishing (and the user therefore is not entitled to the reward).

```
// Subscribe to rewarded ad events
void OnEnable()
{
    Advertising.RewardedAdCompleted += RewardedAdCompletedHandler;
    Advertising.RewardedAdSkipped += RewardedAdSkippedHandler;
}

// Unsubscribe events
void OnDisable()
{
    Advertising.RewardedAdCompleted -= RewardedAdCompletedHandler;
    Advertising.RewardedAdSkipped -= RewardedAdSkippedHandler;
}

// Event handler called when a rewarded ad has completed
void RewardedAdCompletedHandler(RewardedAdNetwork network, AdLocation location)
{
    Debug.Log("Rewarded ad has completed. The user should be rewarded now.");
}

// Event handler called when a rewarded ad has been skipped
void RewardedAdSkippedHandler(RewardedAdNetwork network, AdLocation location)
{
    Debug.Log("Rewarded ad was skipped. The user should NOT be rewarded.");
}
```

Remove Ads

In some cases you need to remove/stop showing ads in your game, e.g. when the user purchases the "Remove Ads" product. To remove ads:

```
// Remove ads permanently
Advertising.RemoveAds();
```

The *RemoveAds* method will destroy the banner ad if one is being shown, and prevent future ads from being loaded and shown except rewarded ads, since they are unobtrusive and only shown at the user discretion.

Note that the *RemoveAds* method uses Unity's PlayerPrefs to store the ad removal status with no encryption/scrambling.

An *AdsRemoved* event will be fired after ads have been removed. You can listen to this event and take appropriate actions, e.g update the UI.

```
// Subscribe to the event
void OnEnable()
{
    Advertising.AdsRemoved += AdsRemovedHandler;
}

// The event handler
void AdsRemovedHandler()
{
    Debug.Log("Ads were removed.");

    // Unsubscribe
    Advertising.AdsRemoved -= AdsRemovedHandler;
}
```

You can also check at any time if ads were removed or not.

```
// Determine if ads were removed
bool isRemoved = Advertising.IsAdRemoved();
```

Finally, you can also revoke the ad removing status and allow ads to be shown again.

```
// Revoke ad removing status and allow showing ads again
Advertising.ResetRemoveAds();
```

Manual Ad Loading

Normally you don't need to worry about loading ads if the automatic ad loading feature is enabled (see **Configure Advertising Module** section). Otherwise, if you choose to disable this feature, you can load ads manually from script.

It is advisable to load an ad as far in advance of showing it as possible to allow time for the ad to be loaded.

To load an interstitial ad:

```
// Load an interstitial ad
Advertising.LoadInterstitialAd();
```

To load a rewarded ad:

```
// Load a rewarded ad
Advertising.LoadRewardedAd();
```

Working with Non-Default Ad Networks

Beside the default ad networks, you can also load and show ads from non-default networks, thus creating a more sophisticated ad network combination in your app. Note that each method to load or show ad always has a variant that allows you to specify the target ad network explicitly. For example there're 2 variants of the *LoadInterstitialAd* method. One takes no argument and loads the default interstitial ad. The other loads an interstitial ad from a network specified explicitly. If you have AdMob as the default interstitial ad network, you can load and show interstitial ad from the non-default AdColony like below.

The Automatic Ad Loading feature won't handle non-default ads, so you need to load ads manually before showing them.

```
// This method shows an interstitial ad from the default network (i.e. AdMob in this example).
// Default ads are loaded automatically so you won't need to load them manually,
// unless Automatic Ad Loading is disabled.
if (Advertising.IsInterstitialAdReady())
    Advertising.ShowInterstitialAd();

...
// Non-default ads are not loaded automatically, so you need to load them manually before they can be shown.
// You should do this early to allow sufficient time for an ad to be loaded before showing it.
// In this example, we'll load and show an interstitial ad from the non-default network AdColony.
Advertising.LoadInterstitialAd(InterstitialAdNetwork.AdColony, AdLocation.Default);

...
// Checks if an AdColony interstitial ad is ready and shows it.
if (Advertising.IsInterstitialAdReady(InterstitialAdNetwork.AdColony, AdLocation.Default))
    Advertising.ShowInterstitialAd(InterstitialAdNetwork.AdColony, AdLocation.Default)
;
```

PlayMaker Actions

The PlayMaker actions of the Advertising module are group in the category *Easy Mobile - Advertising* in the PlayMaker's Action Browser.

Please refer to the AdvertisingDemo_PlayMaker scene in folder *Assets/EasyMobile/Demo/PlayMakerDemo/Modules* for an example on how these actions can be used.

Game Services

The Game Services module helps you quickly implement leaderboards and achievements for your game. It works with the Game Center network on iOS and Google Play Games services on Android. Here're some highlights of this module:

- **Leverages official plugins**
 - This module is built on top of Unity's GameCenterPlatform on iOS and [Google Play Games plugin](#) on Android
 - GameCenterPlatform is one part of the UnityEngine itself while the other is the official Google Play Games plugin for Unity, so reliability and compatibility can be expected
- **Easy management of leaderboards and achievements**
 - Easy Mobile's custom editor features a friendly interface that help you easily add, edit or remove leaderboards and achievements

Module Configuration

To use the Game Services module you must first enable it. Go to *Window > Easy Mobile > Settings*, select the Game Services tab, then click the right-hand side toggle to enable and start configuring the module.

Android-Specific Setup

Import Google Play Games plugin for Unity

As stated earlier, this module is built on top of [Google Play Games Plugin](#) on Android.

Therefore you need to import it to use the module on this platform. Easy Mobile will automatically detect the availability of the plugin and prompt you to import it if needed. Below is the module settings interface on Android platform when Google Play Games plugin hasn't been imported.

Click the *Download Google Play Games Plugin* button to open the download page, then download the package and import it to your project. Once the import completes the module interface will be updated and ready for you to start with the configuration.

Since we're not using Google Play Games plugin on iOS, the NO_GPGS symbol will be defined for iOS platform automatically after the plugin is imported in order to disable it.

Setup Google Play Games

To setup Google Play Games plugin, you need to obtain the game resources from the Google Play Developer Console.

The game resources are available after you configured your game on the Google Play Developer Console. If you're not familiar with the process, please follow the instructions on creating a [client ID](#), as well as [leaderboards](#) and [achievements](#).

To get the game resources, login to your Google Play Developer Console, select *Game services* tabs then select your game. Next go to the *Achievements* tab and click on the *Get Resources* label at the bottom of the list.

The screenshot shows the Google Play Developer Console interface. On the left, there's a sidebar with various analytics and game details sections. The main area is titled 'Achievements' and shows one achievement listed:

#	NAME	ID	POINTS	UNLOCKED %	STATUS
1	Welcome	Cgkdl...AQ	5	—	Ready to test

Below the achievement list, a yellow bar displays the message: "You need to add at least 4 more achievements to publish your game". A red callout bubble with the text "Click this to get the resources" points to the "Get resources" button located at the bottom of the achievement list.

Copy all the xml content from the *Android* tab.

EXPORT RESOURCES

Android **Objective-C** **Javascript** **Text**

```
<?xml version="1.0" encoding="utf-8"?>
<!--
Google Play game services IDs.
Save this file as res/values/games-ids.xml in your project.
-->
<resources>
<string name="app_id">41[REDACTED]31</string>
<string name="package_name">com.[REDACTED].minimal</string>
<string name="achievement_welcome">CgkIgrCK24cTEAIQAw</string>
</resources>
```

Done

Go back to Unity, in the **[ANDROID] GOOGLE PLAY GAMES SETUP** section, paste the obtained xml resources into the **Android XML Resources** area, then click *Setup Google Play Games*.

[ANDROID] GOOGLE PLAY GAMES SETUP

GPGS Debug Log

Paste in the Android XML Resources from the Play Console and hit the Setup button.

Android XML Resources

```
<?xml version="1.0" encoding="utf-8"?>
<!--
Google Play game services IDs.
Save this file as res/values/games-ids.xml in your project.
-->
<resources>
<string name="app_id">6549[REDACTED]</string>
<string name="package_name">com.sgilib.easymobile</string>
<string name="achievement_sample_achievement_1">CgkIgrCK24cTEAIQAw</string>
<string name="achievement_sample_achievement_2">CgkIgrCK24cTEAIQAw</string>
<string name="achievement_sample_achievement_3">CqklqrCK24cTEAIQBA</string>
```

Setup Google Play Games

After the setup has completed, a new file named EM_GPGSIds will be created at `Assets/EasyMobile/Generated`. This file contains the constants of the IDs of all the leaderboards and achievements in your Android game.

Enable Google Play Games Debug Log

To enable Google Play Games debug log, simply check the *GPGS Debug Log* option in the **[ANDROID] GOOGLE PLAY GAMES SETUP** section.

Auto Initialization

Auto initialization is a feature of the Game Services module that initializes the service automatically when the module starts. Initialization is required before any other actions can be done, e.g. reporting scores.

During the initialization, the system will try to authenticate the user by presenting a login popup.

- On iOS, this popup will show up when the app gets focus (brought to foreground) for the first 3 times. If the user refuses to login all these 3 times, the OS will ignore subsequent authentication calls and stop presenting the login popup (to avoid disturbing the user). Otherwise, if the user has logged in successfully, future authentication will take place silently with no login popup presented.
- On Android, we employ a similar approach but you can configure the maximum number of authentication requests before ignoring subsequent ones.

You can configure the auto initialization feature within the **AUTO-INIT CONFIG** section.

- *Auto Init*: uncheck this option to disable the auto initialization feature, you can start the initialization manually from script (see the **Scripting** section)
- *Auto Init Delay*: how long after the module start that the initialization should take place
- *[Android] Max Login Requests*: maximum number of authentication requests allowed on Android, before ignoring subsequent ones (in case the user refuses to login)

"Module start" refers to the moment the *Start* method of the module's associated MonoBehavior (attached to the EasyMobile prefab) runs.

Leaderboards & Achievements

This section provides a guide to manage leaderboards and managements for your game.

Before You Begin

It is assumed that you already configured your game for the targeted gaming networks, i.e. Game Center and Google Play Games. If you're not familiar with the process, here're some useful links:

- Configure for Google Play Games (Android)
 - [Creating a Client ID for you game](#)
 - [Adding leaderboards](#)
 - [Adding achievements](#)
- Configure for Game Center (iOS)
 - [Adding leaderboards and achievements in iTunes Connect](#)

In the **LEADERBOARD SETUP** and **ACHIEVEMENT SETUP** you can add, edit or remove leaderboards and achievements.

Add a New Leaderboard or Achievement

To add a new leaderboard click the *Add New Leaderboard* button (or *Add New Achievement* button in case of an achievement).

A new empty leaderboard (or achievement) will be added.

Fill in the required information of the leaderboard (or achievement):

- *Name*: the name of this leaderboard (or achievement), this name can be used when reporting scores to this leaderboard (or unlocking this achievement)
- *iOS Id*: the ID of this leaderboard (or achievement) as declared in iTunes Connect

- *Android Id*: the ID of this leaderboard (or achievement) as declared in Google Play Developer Console

Google Play Games' leaderboards and achievements have generated IDs which can be difficult to memorize and cumbersome to copy-and-paste, especially if there are many of them. Thankfully, when you setup Google Play Games, the constants of these IDs are generated automatically (remember that EM_GPGSIds file?), allowing Easy Mobile to show a nice dropdown of all defined leaderboard and achievement IDs for you to choose from.

Remove a Leaderboard or Achievement

To remove a leaderboard (or achievement), simply click the [-] button at the right hand side.

Arrange Leaderboards or Achievements

You can use the two arrow-up and arrow-down buttons to move a leaderboard (or achievement) upward or downward within its array.

Constants Generation

Constants generation is a feature of the Game Services module. It reads the names of all the added leaderboards and achievements and generates a static class named EM_GameServicesConstants that contains the constants of these names. Later, you can use these constants when reporting scores to a leaderboard or unlocking an achievement in script instead of typing the names directly, thus help prevent runtime errors due to typos and the likes.

To generate the constants class (you should do this after adding all required leaderboards and achievements), click the **Generate Constants Class** button within the **CONSTANTS CLASS GENERATION** section.

When the process completes, a file named EM_GameServicesConstants will be created at *Assets/EasyMobile/Generated*.

Saved Games

Saved Games feature is available on Easy Mobile Pro only.

Saving game data is among the most desirable features of video games in general, and mobile games in particular. Nowadays, it's not uncommon for a user to own more than one mobile device, be it phone or tablet. Being able to start a game on one device, and then continue playing on another device without losing any progress brings a seamless - if not natural - user experience.

The Saved Games feature of Easy Mobile makes it possible - and easy - to save a player's game data to the cloud and synchronize it across multiple devices. Saving user data to the cloud also means that their game progression is preserved and can be restored in cases such as reinstallation or device failure.

On iOS, the game data is saved to iCloud via the Game Center (GameKit) API. On Android, it is saved to Google Drive via the Google Play Game Services API (GPGS).

Understanding Saved Games

A saved game consists of two parts:

- An unstructured binary blob - this can represent whatever data you deem relevant to your game, and your game is responsible for generating and interpreting it.
- Structured metadata - additional properties associated with the binary data and provide information about this data.

The table below describes common saved game properties.

Property	Description
Name	A developer-supplied short name of the saved game
ModificationDate	A timestamp corresponding to the last modification of the saved game
DeviceName	[iOS only] The name of the device that committed the saved game data
Description	[GPGS only][Optional] A developer-supplied description of the saved game
CoverImageURL	[GPGS only] [Optional] The URL of the PNG cover image of the saved game
TotalTimePlayed	[GPGS only][Optional] A developer-supplied value (in milisecounds) representing the played time of the saved game
IsOpen	Whether the saved game is "Open". A saved game can only be read or written to if it is open.

It's up to you to decide how and when users can save a game. Depending on your game design, you might want to allow only a single saved game, or you might want to allow the player to create multiple saved games with different names (so they can, for example, go back to various checkpoints and try different actions).

The Underlying Cloud Services

As mentioned earlier, saved games are stored on iCloud (iOS/Game Center) and Google Drive (Android/GPGS). Therefore, it's mandatory that the user has an iCloud or Google account to use the feature on the corresponding platform.

On iOS, the saved games are tied to the user's iCloud account, not the Game Center account.

On Android, the Google Drive associated with the user's Google account that was authenticated with GPGS is used.

Limitations

iOS (iCloud/Game Center)	Android (Google Drive/GPGS)
No hard limit on the number of saved games	No hard limit on the number of saved games
The size of a saved game data is limited to the amount of available space in the user's iCloud account)	GPGS currently enforce size limits on binary data and cover image sizes of 3 MB and 800 KB respectively.

You should always strive to minimize the amount of data being saved. This prevents the user from running out of space and decreases the amount of time required to fetch or save a game file. Also note that the game saving operation may fail if there's not enough room in the iCloud or Google Drive account of the user.

Offline Support

Your game can still read and write to a saved game when the player's device is offline, but will not be able to sync with the cloud services until network connectivity is established. Once reconnected, the synchronization will be done automatically and asynchronously.

Conflict Resolution

When a user plays your game on multiple devices and uses the saved games feature, it's not uncommon to have multiple saved games with the same name and from different devices, thus creating conflicts. These conflicts typically occur when an instance of your game is unable to reach the cloud service while attempting to sync the save game data, or when it updates the saved game data on the cloud without loading the latest data first. In general, the best way to avoid data conflicts is to always load the latest data from the cloud service when your game starts up or resumes, and save data to the service with reasonable frequency. However, it is not always possible to avoid data conflicts. Your application should make every effort to handle conflicts to preserve users' data as well as maintain a good user experience. Fortunately, the Saved Games API can help you resolve these conflicts automatically using several default resolution strategies. It also provides relevant methods to help you implement your own resolution strategy to better suit your needs.

In this [GameOn! - Saved Games In-Depth \(Part 2\) YouTube video](#) by Google Developers you'll find in-depth explanation on conflicts between saved games, how they happen, how to resolve them as well as other important concepts. The video is dedicated to the Saved Games feature of Google Play Games Services, but the concepts are also applicable to Game Center. A must watch.

Useful Links

1. [Saving A Game - Game Center Programming Guide](#)
2. [Saved Games - Google Play Game Services](#)
3. [GameOn! - Saved Games In-Depth \(Part 2\) YouTube video](#)

Saved Games Configuration

The Saved Games feature can be configured in the **SAVED GAMES CONFIG** section in the Game Service module settings.

- *Enable Saved Games*: you must enable the Saved Games feature before using it
- *Conflict Resolution Strategy*: the default strategy used by the automatic conflict resolution feature
- *[Android] Data Source*: where the game data can be fetched from, only applicable on Android/Google Play Game Services platform

iOS-Specific Setup

To use the Saved Games service on iOS, you must enable the iCloud capability for your app in the Xcode project. Make sure the *iCloud Documents* service is selected.

Also, for the feature to function on their iOS devices, the users must sign into their iCloud account and have the iCloud Drive service enabled in the Settings app.

Android-Specific Setup

Again, on Android we employ the Saved Games feature provided by the Google Play Game Services. Therefore, you need to enable this feature for your app in the Google Play Console. Select your app, then select the **Game Services** tab and enable the feature in the **Game details** tab.

Note that you need to wait at least 24 hours after enabling the Saved Games service for it to be available. Attempting to authenticate during this time may cause the app to crash.

Scripting

This section provides a guide to work with the Game Services API.

You can access the Game Services module API via the `GameServices` class under the `EasyMobile` namespace.

Initialization

Initialization is required before any other action, e.g. reporting scores, can be done. It should only be done once when the app is loaded. If you have enabled the Auto initialization feature, you don't need to initialize in script (see **Auto Initialization** section). Otherwise, if you choose to disable that feature, you can start the initialization in a couple of ways.

- Managed initialization: this method respects the *Max Login Requests* value on Android (see **Auto Initialization** section), which means it will ignore all subsequent calls once the user has dismissed the login popup for a number of time determined by *Max Login Requests*
- Unmanaged initialization: this method simply initializes the module, on Android it shows the login popup every time as long as the user hasn't been authenticated

On iOS, the system automatically limits the maximum number of login requests to 3 no matter which method is used.

To use the managed initialization method:

```
// Managed init respects the Max Login Requests value
GameServices.ManagedInit();
```

To use the unmanaged initialization method:

```
// Unmanaged init
GameServices.Init();
```

Note that the initialization should be done early and only once, e.g. you can put it in the *Start* method of a `MonoBehaviour`, preferably a singleton one so that it won't run again when the scene reloads.

```
// Initialization in the Start method of a MonoBehaviour script
void Start()
{
    // Managed init respects the Max Login Requests value
    GameServices.ManagedInit();

    // Do other stuff...
}
```

A *UserLoginSucceeded* event will be fired when the initialization completes and the user logsins successfully. Otherwise, a *UserLoginFailed* event will be fired instead. You can optionally subscribe to these events and take appropriate actions depended on the user login status.

```
// Subscribe to events in the OnEnable method of a MonoBehavior script
void OnEnable()
{
    GameServices.UserLoginSucceeded += OnUserLoginSucceeded;
    GameServices.UserLoginFailed += OnUserLoginFailed;
}

// Unsubscribe
void OnDisable()
{
    GameServices.UserLoginSucceeded -= OnUserLoginSucceeded;
    GameServices.UserLoginFailed -= OnUserLoginFailed;
}

// Event handlers
void OnUserLoginSucceeded()
{
    Debug.Log("User logged in successfully.");
}

void OnUserLoginFailed()
{
    Debug.Log("User login failed.");
}
```

You can also check if the module has been initialized at any point using the *IsInitialized* method.

```
// Check if initialization has completed (the user has been authenticated)
bool isInitialized = GameServices.IsInitialized();
```

Leaderboards

This section focuses on working with leaderboards.

Show Leaderboard UI

To show the default leaderboard UI (the system view of leaderboards):

```
// Show leaderboard UI  
GameServices.ShowLeaderboardUI();
```

You should check if the initialization has finished (the user has been authenticated) before showing the leaderboard UI, and take appropriate actions if the user is not logged in, e.g. show an alert or start another initialization process.

```
// Check for initialization before showing leaderboard UI  
if (GameServices.IsInitialized())  
{  
    GameServices.ShowLeaderboardUI();  
}  
else  
{  
    #if UNITY_ANDROID  
    GameServices.Init();      // start a new initialization process  
    #elif UNITY_IOS  
    Debug.Log("Cannot show leaderboard UI: The user is not logged in to Game Center.");  
;  
    #endif  
}
```

To show the UI of a specific leaderboard, simply pass the name of the leaderboard into the *ShowLeaderboardUI* method. You can also optionally specify the time scope:

```
// Show a specific leaderboard UI  
GameServices.ShowLeaderboardUI("YOUR_LEADERBOARD_NAME");  
  
// Show a specific leaderboard UI in the Week time scope  
GameServices.ShowLeaderboardUI("YOUR_LEADERBOARD_NAME", TimeScope.Week);
```

Report Scores

To report scores to a leaderboard you need to specify the name of that leaderboard.

It is strongly recommended that you use the constants of leaderboard names in the generated EM_GameServicesConstants class (see **Game Services Constants Generation** section) instead of typing the names directly in order to prevent runtime errors due to typos and the likes.

```
// Report a score of 100
// EM_GameServicesConstants.Sample_Leaderboard is the generated name constant
// of a leaderboard named "Sample Leaderboard"
GameServices.ReportScore(100, EM_GameServicesConstants.Sample_Leaderboard);
```

Load Local User's Score

You can load the score of the local user (the authenticated user) on a leaderboard, to do so you need to specify the name of the leaderboard to load score from and a callback to be called when the score is loaded.

```
// Put this on top of the file to use IScore
UnityEngine.SocialPlatforms;

...
// Load the local user's score from the specified leaderboard
// EM_GameServicesConstants.Sample_Leaderboard is the generated name constant
// of a leaderboard named "Sample Leaderboard"
GameServices.LoadLocalUserScore(EM_GameServicesConstants.Sample_Leaderboard, OnLocalUserScoreLoaded);

...
// Score loaded callback
void OnLocalUserScoreLoaded(string leaderboardName, IScore score)
{
    if (score != null)
    {
        Debug.Log("Your score is: " + score.value);
    }
    else
    {
        Debug.Log("You don't have any score reported to leaderboard " + leaderboardName);
    }
}
```

Load Scores

You can load a set of scores from a leaderboard with which you can specify the start position to load score, the number of scores to load, as well as the time scope and user scope.

```
// Put this on top of the file to use IScore
UnityEngine.SocialPlatforms;

...
// Load a set of 20 scores starting from rank 10 in Today time scope and Global user scope
// EM_GameServicesConstants.Sample_Leaderboard is the generated name constant
// of a leaderboard named "Sample Leaderboard"
GameServices.LoadScores(
    EM_GameServicesConstants.Sample_Leaderboard,
    10,
    20,
    TimeScope.Today,
    UserScope.Global,
    OnScoresLoaded
);

...
// Scores loaded callback
void OnScoresLoaded(string leaderboardName, IScore[] scores)
{
    if (scores != null && scores.Length > 0)
    {
        Debug.Log("Loaded " + scores.Length + " from leadeboard " + leaderboardName);
        foreach (IScore score in scores)
        {
            Debug.Log("Score: " + score.value + "; rank: " + score.rank);
        }
    }
    else
    {
        Debug.Log("No score loaded.");
    }
}
```

You can also load the default set of scores, which contains 25 scores around the local user's score in the *AllTime* time scope and *Global* user scope.

```
// Put this on top of the file to use IScore
UnityEngine.SocialPlatforms;

...
// Load the default set of scores
// EM_GameServicesConstants.Sample_Leaderboard is the generated name constant
// of a leaderboard named "Sample Leaderboard"
GameServices.LoadScores(EM_GameServicesConstants.Sample_Leaderboard, OnScoresLoaded);

...
// Scores loaded callback
void OnScoresLoaded(string leaderboardName, IScore[] scores)
{
    if (scores != null && scores.Length > 0)
    {
        Debug.Log("Loaded " + scores.Length + " from leadeboard " + leaderboardName);
        foreach (IScore score in scores)
        {
            Debug.Log("Score: " + score.value + "; rank: " + score.rank);
        }
    }
    else
    {
        Debug.Log("No score loaded.");
    }
}
```

Get All Leaderboards

You can obtain an array of all leaderboards created in the module settings interface:

```
// Get the array of all leaderboards created in the Game Service module settings
// Leaderboard is the class representing a leaderboard as declared in the module settings
// The GameServices property of EM_Settings class holds the settings of this module
Leaderboard[] leaderboards = EM_Settings.GameServices.Leaderboards;

// Print all leaderboard names
foreach (Leaderboard ldb in leaderboards)
{
    Debug.Log("Leaderboard name: " + ldb.Name);
}
```

Achievements

This section focuses on working with achievements.

Show Achievement UI

To show the achievements UI (the system view of achievements):

```
// Show achievements UI  
GameServices.ShowAchievementsUI();
```

You should check if the initialization has finished (the user has been authenticated) before showing the achievements UI, and take appropriate actions if the user is not logged in, e.g. show an alert or start another initialization process.

```
// Check for initialization before showing achievements UI  
if (GameServices.IsInitialized())  
{  
    GameServices.ShowAchievementsUI();  
}  
else  
{  
    #if UNITY_ANDROID  
    GameServices.Init();      // start a new initialization process  
    #elif UNITY_IOS  
    Debug.Log("Cannot show achievements UI: The user is not logged in to Game Center."  
);  
    #endif  
}
```

Reveal an Achievement

To reveal a hidden achievement, simply specify its name.

As in the case of leaderboards, it is strongly recommended that you use the constants of achievement names in the generated EM_GameServicesConstants class instead of typing the names directly.

```
// Reveal a hidden achievement  
// EM_GameServicesConstants.Sample_Achievement is the generated name constant  
// of an achievement named "Sample Achievement"  
GameServices.RevealAchievement(EM_GameServicesConstants.Sample_Achievement);
```

Unlock an Achievement

To unlock an achievement:

```
// Unlock an achievement  
// EM_GameServicesConstants.Sample_Achievement is the generated name constant  
// of an achievement named "Sample Achievement"  
GameServices.UnlockAchievement(EM_GameServicesConstants.Sample_Achievement);
```

Report Incremental Achievement's Progress

To report the progress of an incremental achievement:

```
// Report a rogress of 50% for an incremental achievement  
// EM_GameServicesConstants.Sample_Incremental_Achievement is the generated name const  
ant  
// of an incremental achievement named "Sample Incremental Achievement"  
GameServices.ReportAchievementProgress(EM_GameServicesConstants.Sample_Incremental_Ach  
ievement, 50.0f);
```

Get All Achievements

You can obtain an array of all achievements created in the module settings interface:

```
// Get the array of all achievements created in the Game Service module settings  
// Achievement is the class representing an achievement as declared in the module sett  
ings  
// The GameService property of EM_Settings class holds the settings of this module  
Achievement[] achievements = EM_Settings.GameServices.Achievements;  
  
// Print all achievement names  
foreach (Achievement acm in achievements)  
{  
    Debug.Log("Achievement name: " + acm.Name);  
}
```

Load User Profiles

You can load the profiles of friends of the local (authenticated) user. When the loading completes the provided callback will be invoked.

```
// Put this on top of the file to use IUserProfile
UnityEngine.SocialPlatforms;

...
// Load the local user's friend list
GameServices.LoadFriends(OnFriendsLoaded);

...
// Friends loaded callback
void OnFriendsLoaded(IUserProfile[] friends)
{
    if (friends.Length > 0)
    {
        foreach (IUserProfile user in friends)
        {
            Debug.Log("Friend's name: " + user.userName + "; ID: " + user.id);
        }
    }
    else
    {
        Debug.Log("Couldn't find any friend.");
    }
}
```

You can also load user profiles by providing their IDs.

```
// Put this on top of the file to use IUserProfile
UnityEngine.SocialPlatforms;

...
// Load the profiles of the users with provided IDs
// idArray is the (string) array of the IDs of the users to load profiles
GameServices.LoadUsers(idArray, OnUsersLoaded);

...
// Users loaded callback
void OnUsersLoaded(IUserProfile[] users)
{
    if (users.Length > 0)
    {
        foreach (IUserProfile user in users)
        {
            Debug.Log("User's name: " + user.userName + "; ID: " + user.id);
        }
    }
    else
    {
        Debug.Log("Couldn't find any user with the specified IDs.");
    }
}
```

Sign Out

To sign the user out, simply call the *SignOut* method. Note that this method is only effective on Android.

```
// Sign the user out on Android
GameServices.SignOut();
```

Saved Games Scripting

Saved Games feature is available on Easy Mobile Pro only.

This section provides a guide to work with the Saved Games API of the Game Services module.

You can access the Saved Games API via the `SavedGames` property of the `GameServices` class under the `EasyMobile` namespace.

Working with saved games involves the following operations:

Operation	Description
Open	A saved game must be opened before it can be used for read or write operation. If you attempt to open a non-existing saved game, a new one will be created and will be opened automatically. You must resolve any conflicts associated with a saved game when opening it. You can have the conflicts resolved automatically using one of the default strategies, or implement your own strategy to resolve them manually.
Write	Update the data associated with a saved game, the saved game must be open before writing, and it will be closed automatically after the operation has finished.
Read	Retrieve the data associated with a saved game, the saved game must be open.
Delete	Delete a saved game from the cloud service

Open a Saved Game

You can open a saved game using either the `OpenWithAutomaticConflictResolution` or the `OpenWithManualConflictResolution` method. Both methods open a saved game with the specified name, or create a new one if none exists. The saved game returned in their callbacks will be open which means it can be used for read or write operation. The difference between the two is whether saved game conflicts, if any, will be resolved automatically or manually.

If the current platform is Google Play Game Services, these methods use the data source specified in the module settings.

OpenWithAutomaticConflictResolution

As its name suggests, when opening a saved game using this method, any outstanding conflicts will be resolved automatically using the resolution strategy specified in the module settings.

```
using EasyMobile;

...

private SavedGame mySavedGame;

// Open a saved game with automatic conflict resolution
void OpenSavedGame()
{
    // Open a saved game named "My_Saved_Game" and resolve conflicts automatically
    // if any.
    GameServices.SavedGames.OpenWithAutomaticConflictResolution("My_Saved_Game", 0
    penSavedGameCallback);
}

// Open saved game callback
void OpenSavedGameCallback(SavedGame savedGame, string error)
{
    if (string.IsNullOrEmpty(error))
    {
        Debug.Log("Saved game opened successfully!");
        mySavedGame = savedGame;           // keep a reference for later operatio
    ns
    }
    else
    {
        Debug.Log("Open saved game failed with error: " + error);
    }
}
```

OpenWithManualConflictResolution

If the saved game being opened has outstanding conflicts, they will be resolved manually using the specified conflict resolution function. This function must be implemented by you and it is where you provide your custom conflict resolution strategy, in case none of the default strategies suits your needs. The function will be invoked automatically when a conflict is encountered while opening a saved game and can be invoked multiple times if the saved game has more than one outstanding conflict. Therefore it must be designed to handle multiple invocations.

The conflict resolution function receives the Base and Remote versions of the conflicting saved game (please check out this [GameOn! - Saved Games In-Depth \(Part 2\) YouTube video](#) by Google Developers for an excellent explanation on the concepts of "base" and

"remote"). These passed saved games are all open. If *OpenWithManualConflictResolution* was invoked with *prefetchDataOnConflict* set to true, the binary data associated with these saved games will be loaded and passed to the conflict resolution function too. Use the return value of this function to determine whether the base or the remote will be chosen as the canonical version of the saved game.

The callback will be invoked when all conflicts (if any) have been resolved and the operation finishes.

```
using EasyMobile;

...

private SavedGame mySavedGame;

// Open a saved game with manual conflict resolution
void OpenSavedGame()
{
    // Open a saved game named "My_Saved_Game" and resolve any outstanding conflicts manually using
    // the specified resolution function.
    GameServices.SavedGames.OpenWithManualConflictResolution(
        "My_Saved_Game",
        true,           // prefetchDataOnConflict
        MyConflictResolutionFunction,
        OpenSavedGameCallback
    );
}

// The conflict resolution function.
// baseGame and remoteGame are all open.
// If OpenWithManualConflictResolution was invoked with prefetchDataOnConflict set to true,
// baseData and remoteData will contain the binary data associated with baseGame and remoteGame respectively.
// They will be null otherwise.
// In this function you can perform required calculation, comparison between two versions, etc. to decide
// which one will be the canonical version of the saved game. Use the return value to indicate your decision.
SavedGameConflictResolutionStrategy MyConflictResolutionFunction(SavedGame baseGame, byte[] baseData,
                                                                SavedGame remoteGame, byte[] remoteData)
{
    {
        // Perform whatever required calculation, comparison, etc. on the two versions
        // and their associated data to help you decide which version should be chosen.
        ...
    }
}
```

```
        // After determining the canonical version, use the return value to indicate your choice
        return SavedGameConflictResolutionStrategy.UseBase;          // use the base version

        // If you want to select the remote version instead, just change it to
        // return SavedGameConflictResolutionStrategy.UseRemote;
    }

}

// Open saved game callback
void OpenSavedGameCallback(SavedGame savedGame, string error)
{
    if (string.IsNullOrEmpty(error))
    {
        Debug.Log("Saved game opened successfully!");
        mySavedGame = savedGame;          // keep a reference for later operations
    }
    else
    {
        Debug.Log("Open saved game failed with error: " + error);
    }
}
```

In case you want to merge the data from different versions, simply specify either the base or the remote as the chosen version. Once all conflicts are resolved and the saved has been opened successfully, perform a write operation using the merge data.

Writing Saved Game Data

To commit new data to a saved game, use the *WriteSavedGameData* method. As mentioned earlier, the saved game must be open before writing or the operation will fail. When this method completes successfully, the data is durably persisted to disk and will eventually be uploaded to the cloud (in practice, this process happens very quickly unless the device doesn't have a network connection). After the operation finishes, the saved game will be closed automatically. This is to force it to be opened once again (thus resolving any outstanding conflicts) before another commit can be made.

```
using EasyMobile;

...

// Updates the given binary data to the specified saved game
void WriteSavedGame(SavedGame savedGame, byte[] data)
{
    if (savedGame.IsOpen)
    {
        // The saved game is open and ready for writing
        GameServices.SavedGames.WriteSavedGameData(
            savedGame,
            data,
            (SavedGame updatedSavedGame, string error) =>
        {
            if (string.IsNullOrEmpty(error))
            {
                Debug.Log("Saved game data has been written successfully!");
            }
            else
            {
                Debug.Log("Writing saved game data failed with error: " + error);
            }
        });
    }
    else
    {
        // The saved game is not open. You can optionally open it here and repeat the
        process.
        Debug.Log("You must open the saved game before writing to it.");
    }
}
```

Beside the binary data, you can also update the metadata (properties) of a saved game. Just use the overloading version of `WriteSavedGameData` that accepts a `SavedGameInfoUpdate` struct.

Some saved game properties are only available on a certain platform, please review the **Game Service > Module Configuration > Saved Game** section for detailed information.

```
using EasyMobile;

...

// Updates the binary data AND the properties of a saved game
void WriteSavedGame(SavedGame savedGame, byte[] data)
{
    if (savedGame.IsOpen)
    {
        // The saved game is open and ready for writing
        // Prepare the updated metadata of the saved game
        SavedGameInfoUpdate.Builder builder = new SavedGameInfoUpdate.Builder();
        builder.WithUpdatedDescription("New_Description");
        builder.WithUpdatedPlayedTime(TimeSpan.FromMinutes(30));      // update the played time to 30 minutes
        SavedGameInfoUpdate infoUpdate = builder.Build();

        GameServices.SavedGames.WriteSavedGameData(
            savedGame,
            data,
            infoUpdate,      // update saved game properties
            (SavedGame updatedSavedGame, string error) =>
        {
            if (string.IsNullOrEmpty(error))
            {
                Debug.Log("Saved game data has been written successfully!");
            }
            else
            {
                Debug.Log("Writing saved game data failed with error: " + error);
            }
        });
    }
    else
    {
        // The saved game is not open. You can optionally open it here and repeat the process.
        Debug.Log("You must open the saved game before writing to it.");
    }
}
```

Reading Saved Game Data

To read a saved game data, use the `ReadSavedGameData` method. The saved game must be open before reading. The callback will be invoked when the operation finishes and will receive the retrieved data as a byte array, which can be empty if the saved game has no data committed previously.

```
using EasyMobile;

...

// Retrieves the binary data associated with the specified saved game
void ReadSavedGame(SavedGame savedGame)
{
    if (savedGame.IsOpen)
    {
        // The saved game is open and ready for reading
        GameServices.SavedGames.ReadSavedGameData(
            savedGame,
            (SavedGame game, byte[] data, string error) =>
        {
            if (string.IsNullOrEmpty(error))
            {
                Debug.Log("Saved game data has been retrieved successfully!");
                // Here you can process the data as you wish.
                if (data.Length > 0)
                {
                    // Data processing
                    ...
                }
                else
                {
                    Debug.Log("The saved game has no data!");
                }
            }
            else
            {
                Debug.Log("Reading saved game data failed with error: " + error);
            }
        });
    }
    else
    {
        // The saved game is not open. You can optionally open it here and repeat the
        process.
        Debug.Log("You must open the saved game before reading its data.");
    }
}
```

Deleting A Saved Game

To delete a saved game, simply call the DeleteSavedGame method.

```
using EasyMobile;

...
// Deletes a saved game
void DeleteSavedGame(SavedGame savedGame)
{
    GameServices.SavedGames.DeleteSavedGame(savedGame);
}
```

Fetch All Saved Games

When implement the saved games feature in your game, chances are you will want to show the user a list of existing saved games for them to choose from. In such case, you can use the *FetchAllSavedGames* method to retrieve all know saved games. A callback will be invoked when the method completes, receiving an array of saved games which can be empty if no saved game was created before. Note that all the returned saved games are NOT open.

If the current platform is Google Play Game Services, this method retrieves saved games from the data source specified in the module settings.

```
using EasyMobile;

...
// Fetches all know saved games.
void FetchSavedGames()
{
    GameServices.SavedGames.FetchAllSavedGames(
        (SavedGame[] games, string error) =>
    {
        if (string.IsNullOrEmpty(error))
        {
            Debug.Log("Fetched saved games successfully! Got " + games.Length + " saved games.");
            // Here you can show a UI to display these saved games to the user...
        }
        else
        {
            Debug.Log("Fetching saved games failed with error " + error);
        }
    });
}
```

[Android] Built-in Saved Game UI

On Android, the Saved Games feature of Google Play Game Services offers a built-in UI from which the user can open, select or delete a saved games. You can show this UI by calling the *ShowSelectSavedGameUI* method. A callback will be invoked when the UI is closed, receiving the selected saved game if any.

This method is a no-op on iOS/Game Center platform.

```
using EasyMobile;

...

// Shows the GPGS built-in saved game UI.
void ShowGPGSSavedGameUI()
{
    GameServices.SavedGames.ShowSelectSavedGameUI(
        "Select Saved Game",      // UI title
        5,                      // maximum number of displayed saved games
        true,                  // allow creating saved games
        true,                  // allow deleting saved games
        (SavedGame game, string error) =>
    {
        if (string.IsNullOrEmpty(error))
        {
            Debug.Log("You selected saved game: " + game.Name);
        }
        else
        {
            Debug.Log(error);
        }
    }
);
}
```

PlayMaker Actions

The PlayMaker actions of the Game Services module are group in the category *Easy Mobile - Game Services* in the PlayMaker's Action Browser.

Please refer to the GameServicesDemo_PlayMaker scene in folder `Assets/EasyMobile/Demo/PlayMakerDemo/Modules` for an example on how these actions can be used.

Saved Games

The PlayMaker actions of the Saved Games feature are group in the category **Easy Mobile - Saved Games** in the PlayMaker's Action Browser.

Please refer to the GameServicesDemo_SavedGames_PlayMaker scene in folder *Assets/EasyMobile/Demo/PlayMakerDemo/Modules* for an example on how these actions can be used.

The screenshot shows the PlayMaker Actions window with the following interface elements:

- Actions** tab: Shows a list of categories and specific actions.
 - Color
 - Convert
 - Debug
 - Device
 - Easy Mobile - Advertising
 - Easy Mobile - Game Services
 - Easy Mobile - Gif
 - Easy Mobile - In-App Purchasing
 - Easy Mobile - Native APIs
 - Easy Mobile - Notifications
 - Easy Mobile - Saved Games** (selected)
- Saved Game_Delete Saved Game**: A sub-menu under Easy Mobile - Saved Games.
 - Saved Game_Fetch All Saved Games
 - Saved Game_Open With Automatic Conflict Resolution
 - Saved Game_Open With Manual Conflict Resolution
 - Saved Game_Read Saved Game Data
 - Saved Game_Show Select Saved Game UI
 - Saved Game_Write Saved Game Data

 - Deletes the specified saved game. This will delete the data of the saved game locally and on the cloud.
- Global Saved Name**: A text input field.
- Preview**: A checkbox with a checked state.
- Add Action To State**: A button.

GIF

GIF module is available on Easy Mobile Pro only.

The GIF module provides you convenient tools to record screen activities into a short clip, play the recorded clip and export it into a GIF image. You can then upload the GIF file to hosting sites like [Giphy](#) and finally share its URL to social networks. In short, this module helps you easily add the GIF sharing feature to your game, which allows the user to share animated GIF images of the gameplay, instead of still screenshots, to social networks including Facebook and Twitter. The following picture illustrates a typical workflow of such feature.

Here're some highlights of this module:

- **High performance, mobile-friendly GIF generator**
 - Low overhead screen/camera recorder
 - GIF generation is done in native code (iOS and Android) on a separate thread to allow fast exporting while minimizing impact to the main thread. Export callbacks are still called from main thread though, so you can safely access Unity API in the callback handlers
- **Flexible, fully controllable process**
 - You have full control on the sizes, length, frame rate, loop mode and quality of the exported GIF
 - You can also set the priority of the exporting thread to best suit your needs
- **High quality GIF**
 - Exported GIF employs GIF89a format and uses 256-color local palettes (one palette per frame)
 - Frame image data is [LWZ compressed](#)
- **Works in Unity editor**

- GIF exporting also works in the editor, mostly for testing purpose. On mobiles, the exporting is done in native code, while in editor it is done in managed code using an adapted version of the Moments plugin (see the **Acknowledgement** section)
- **Easy GIF sharing**
 - This module also provides Giphy API for uploading GIF images to Giphy, so that they can be shared and played on major social networks including Facebook and Twitter using the Giphy hosted URLs

Acknowledgement

The recorder used in this module is adapted from the recorder of the [Moments plugin](#) by Chman (Thomas Hourdel). Also, in Unity editor, GIF generation is done using an adapted version of this plugin.

Setup

This section explains the various components, objects and concepts involved in clip recording, clip playing and GIF exporting. It also provides a guide on creating and configuring relevant objects and components.

The Recorder component

The Recorder component records the content rendered by a camera and returns the recorded clip. To start recording, simply add a Recorder component to the camera that renders the content you're interested in recording (normally this will be the Main Camera). To add the component to a camera, select that camera in the Hierarchy, then click *Add Component > Easy Mobile > Recorder*.

Once the Recorder component is added to the camera, you can start configuring it in the inspector to determine how the recorded clip (and as a result, the exported GIF) will be like.

- **Auto Height:** whether the clip height should be computed automatically from the

specified width and the camera's aspect ratio, which is useful to make sure the exported GIF has a correct aspect ratio

- *Width*: the width of the recorded clip in pixels
- *Height*: the height of the recorded clip in pixels
- *Frames Per Second*: the frame rate of the clip
- *Length*: the clip length in seconds; the recorder automatically discards old content to preserve this length, e.g. if you set this value to 3 seconds, only last 3 seconds of the recording will be stored in the resulted clip, the rest will be discarded
- *Estimated VRam Usage*: the estimated memory used for recording, calculated based on the above settings
- *Current State*: the current status of the recorder, which is either *Stopped* or *Recording*

Now that the recorder is configured, you can start and stop its recording activity from script (see the **Scripting** section). Once the recording is stopped, the recorded clip will be returned for playback of GIF exporting.

Recording the UI

To record the UI (Canvas content), you need to set the Canvas Render Mode to World Space or Screen Space - Camera, and set the Render Camera to the one containing the Recorder component in the latter case.

Recording multiple composited cameras

If your scene contains multiple cameras being composited (using Camera.depth and Clear flags), you can add the Recorder component to the top-most camera, so it captures whatever content being composited and shown by that camera.

The AnimatedClip class

Recorded clips are represented by the *AnimatedClip* class, which has following properties:

- *Width*: the width of the clip in pixels
- *Height*: the height of the clip in pixels
- *Frame Per Second*: the frame rate of the clip
- *Length*: the length of the clip in seconds
- *Frames*: an array of frames, each frame is a *Render Texture* object

Playback

Easy Mobile provides two built-in objects dedicated for playing recorded clips: the Clip Player and Clip Player UI objects. You can create them from the context menu (as you would with other Unity built-in objects), configure them in the inspector, and start or stop their

playing activity from script (see the **Scripting** section).

Clip Player

The Clip Player is a non-UI object, which is basically a Quad object equipped with a ClipPlayer component. It is meant to be used inside the game world. To create a Clip Player object, right-click in the Hierarchy window to open the context menu, then select *Easy Mobile > Clip Player*.

Each Clip Player object contains a ClipPlayer component.

The only parameter of this component is the *Scale Mode*, which can take one of 3 values:

- *None*: don't adjust the object sizes
- *Auto Height*: keeps the current height of the object (the Y component of its localScale), and adjust the width (the X component of its localScale) to match the aspect ratio of the clip being played
- *Auto Width*: keeps the current width of the object (the X component of its localScale), and adjust the height (the Y component of its localScale) to match the aspect ratio of the clip being played

Clip Player UI

The Clip Player UI, as its name implies, is a UI object living inside a Canvas. It is the object to use when you want to play a clip inside the UI. It is basically a Raw Image object equipped with a ClipPlayerUI component. To create a Clip Player UI object, right-click in the Hierarchy window to open the context menu, then select *Easy Mobile > Clip Player (UI)*.

Each Clip Player UI object contains a ClipPlayerUI component.

The only parameter of this component is the *Scale Mode*, which can take one of 3 values:

- *None*: don't adjust the object sizes
- *Auto Height*: keeps the current height of the object (the Height value in its Rect Transform), and adjust the width (the Width value in its Rect Transform) to match the aspect ratio of the clip being played
- *Auto Width*: keeps the current width of the object (the Width value in its Rect Transform), and adjust the height (the Height value in its Rect Transform) to match the aspect ratio of the clip being played

Custom Clip Player

Beside the two built-in clip players provided by Easy Mobile, you can construct your own player to serve your specific needs. To make it consistent with other players, and compatible with Easy Mobile API, this player should contain a script implementing the *IClipPlayer* interface, which is responsible for applying the frames (*RenderTextures*) of the clip, at the required frame rate, to whatever texture-displaying component it is equipped with.

Scripting

This section provides a guide to work with the GIF API. At this stage, it's assumed that you have setup a recorder for the camera you want to record, and created an appropriate clip player to play the recorded clip. If you're not familiar with these concepts, please review the [Setup](#) section.

You can access the GIF module API via the `Gif` class under the `EasyMobile` namespace. As for Giphy API, use the `Giphy` class.

Recording

To start recording on the created recorder, use the `StartRecording` method. You can do this as soon as the game starts; the recorder only stores a few last seconds (specified by the `Length` parameter in the Recorder inspector) of the recording, and automatically discards the rest.

```
// Use the EasyMobile namespace
using EasyMobile;

...

// Drag the camera with the Recorder component to this field in the inspector
public Recorder recorder;

...

// You can start recording as soon as your game starts
// (suppose you have a method named StartGame, which is called when the game starts)
void StartGame()
{
    // Start recording!
    Gif.StartRecording(recorder);

    // Do other stuff...
}
```

To stop recording, simply call the `StopRecording` method, passing the relevant recorder. The method returns an `AnimatedClip` object, which can be played or exported into a GIF image afterward. To continue the previous example:

```

// Use the EasyMobile namespace
using EasyMobile;

...

// Drag the camera with the Recorder component to this field in the inspector
public Recorder recorder;

// The recorded clip
AnimatedClip myClip;

// You can start recording as soon as your game starts
// (suppose you have a method named StartGame, which is called when the game starts)
void StartGame()
{
    // Start recording!
    Gif.StartRecording(recorder);

    // Do other stuff...
}

...

// A suitable time to stop recording may be when the game ends (the player dies)
// (suppose you have a method named GameOver, called when the game ends)
void GameOver()
{
    // Stop recording
    myClip = Gif.StopRecording(recorder);

    // Do other stuff...
}

```

Playback

To play a recorded clip using a pre-created clip player, use the *PlayClip* method. This method receives as argument an *IClipPlayer* interface, which is implemented by both *ClipPlayer* and *ClipPlayerUI* classes, therefore it works with both Clip Player and Clip Player UI object. The second argument is an *AnimatedClip* object. Other arguments include an optional delay time before the playing starts, and the looping mode. You can pause, resume and stop the player using the *PausePlayer*, *ResumePlayer* and *StopPlayer* methods, respectively.

To continue the previous example:

```

// Use the EasyMobile namespace
using EasyMobile;

```

```
...

// Drag the camera with the Recorder component to this field in the inspector
public Recorder recorder;

// Suppose you've created a ClipPlayerUI object (ClipPlayer will also work)
// Drag the pre-created clip player to this field in the inspector
public ClipPlayerUI clipPlayer;

// The recorded clip
AnimatedClip myClip;

// You can start recording as soon as your game starts
// (suppose you have a method named StartGame, which is called when the game starts)
void StartGame()
{
    // Start recording!
    Gif.StartRecording(recorder);

    // Do other stuff...
}

...

// A suitable time to stop recording may be when the game ends (the player dies)
// (suppose you have a method named GameOver, called when the game ends)
void GameOver()
{
    // Stop recording
    myClip = Gif.StopRecording(recorder);

    // Play the recorded clip!
    PlayMyClip();
}

...

// This method plays the recorded clip on the created player,
// with no delay before playing, and loop indefinitely.
void PlayMyClip()
{
    Gif.PlayClip(clipPlayer, myClip);
}

// This method plays the recorded clip on the created player,
// with a delay of 1 seconds before playing, and loop indefinitely,
// (you can set loop = false to play the clip only once)
void PlayMyClipWithDelay()
{
    Gif.PlayClip(clipPlayer, myClip, 1f, true);
}

// This method pauses the player.
```

```

void PausePlayer()
{
    Gif.PausePlayer(clipPlayer);
}

// This method un-pauses the player.
void UnPausePlayer()
{
    Gif.ResumePlayer(clipPlayer);
}

// This method stops the player.
void StopPlayer()
{
    Gif.StopPlayer(clipPlayer);
}

```

GIF Export

To export the recorded clip into a GIF image, use the *ExportGif* method. In the editor, the exported GIF file will be stored right under the *Assets* folder; on mobile devices, the storage location is [Application.persistentDataPath](#). You can specify the filename and the quality of the GIF image as well as the priority of the exporting thread. The quality setting accepts values from 1 to 100 (inputs will be clamped to this range). Bigger values will result in better looking GIFs, but will take slightly longer processing time; 80 is generally a good value in terms of time-quality balance. This method has two callbacks: one is called repeatedly during the process and receives the progress value (0 to 1), the other is called when the export completes and receives the file path of the generated image. Though the GIF generation process is done in a separate thread, these callbacks are guaranteed to be called from the main thread, so you can safely access all Unity API from within them.

In the rare case that you want to control the looping mode of the exported GIF (the default is loop indefinitely), use the variant of *ExportGif* that has a *loop* parameter (note that some GIF players may ignore this setting):

- *loop < 0*: disable looping (play once)
- *loop = 0*: loop indefinitely
- *loop > 0*: loop a number of times

In the following example, we'll export a GIF image from the recorded clip returned after the recording has stopped.

```

// Use the EasyMobile namespace
using EasyMobile;

...

```

```
// Drag the camera with the Recorder component to this field in the inspector
public Recorder recorder;

// The recorded clip
AnimatedClip myClip;

// You can start recording as soon as your game starts
// (suppose you have a method named StartGame, which is called when the game starts)
void StartGame()
{
    // Start recording!
    Gif.StartRecording(recorder);

    // Do other stuff...
}

...

// A suitable time to stop recording can be when the game ends (the player dies)
// (suppose you have a method named GameOver, called when the game ends)
void GameOver()
{
    // Stop recording
    myClip = Gif.StopRecording(recorder);

    // Export GIF image from the resulted clip
    ExportMyGif();
}

...

// This method exports a GIF image from the recorded clip.
void ExportMyGif()
{
    // Parameter setup
    string filename = "myGif";      // filename, no need the ".gif" extension
    int loop = 0;                  // -1: no loop, 0: loop indefinitely, >0: loop a set
    number of times
    int quality = 80;             // 80 is a good value in terms of time-quality balan
    ce
    System.Threading.ThreadPriority tPriority = System.Threading.ThreadPriority.Normal
; // exporting thread priority

    Gif.ExportGif(myClip,
                  filename,
                  loop,
                  quality,
                  tPriority,
                  OnGifExportProgress,
                  OnGifExportCompleted);
}
```

```
// This callback is called repeatedly during the GIF exporting process.
// It receives a reference to original clip and a progress value ranging from 0 to 1.
void OnGifExportProgress(AnimatedClip clip, float progress)
{
    Debug.Log(string.Format("Export progress: {0:P0}", progress));
}

// This callback is called once the GIF exporting has completed.
// It receives a reference to the original clip and the filepath of the generated image.
void OnGifExportCompleted(AnimatedClip clip, string path)
{
    Debug.Log("A GIF image has been created at " + path);
}
```

Disposing of AnimatedClip

Internally, each *AnimatedClip* object consists of an array of *RenderTexture*, a "native engine object" type, which is not garbage collected as normal managed types. That means these render textures won't be "destroyed" automatically when their containing clip is garbage collected (the clip object does get collected, but the render textures it references don't, thus creating memory leaks). To take care of this issue, we have the *AnimatedClip* implement the *IDisposable* interface and provide the *Dispose* method to release the render textures, as Unity recommended. You *must* call this *Dispose* method, preferably as soon as you're done with using a clip (after playing or exporting GIF), to make sure the render textures are properly released and not cause memory issues.

We'll extend the *OnGifExportCompleted* callback handler of the previous example to dispose the recorded clip as soon as we've generated a GIF image from it.

```
// This callback is called once the GIF exporting has completed.
// It receives a reference to the original clip and the filepath of the generated image.
void OnGifExportCompleted(AnimatedClip clip, string path)
{
    Debug.Log("A GIF image has been created at " + path);

    // We've done using the clip, dispose it to save memory
    if (clip == myClip)
    {
        myClip.Dispose();
        myClip = null;
    }
}
```

GIF Sharing

Now that a GIF image has been created, you may want to share it (because it's not fun otherwise, is it?). A common approach is to first upload the image to [Giphy](#), a popular GIF hosting site, and then share the returned URL to other social networks like Facebook and Twitter, using Easy Mobile's Native Sharing feature (see the *Native Sharing > Scripting* section, in particular the *ShareURL* method).

According to [Giphy API documentation](#), hosted Giphy URLs are supported and play on every major social network.

Upload to Giphy

To upload a GIF image to Giphy, use the *Upload* method of the *Giphy* class. You can upload a local image on your device, or an image hosted online, provided that you have its URL. Before doing so, you'll need to prepare the upload content by creating a *GiphyUploadParams* struct. In this struct you'll specify either the file path of the local image, or the URL of the online image to upload. Note that if both parameters are provided, the local file path will be used over the URL. Within this struct you can also specify other optional parameters such as image tags, the source of the image (e.g. your website), or mark the image as private (only visible by you on Giphy). The *Upload* method has three callbacks: the first one is called repeatedly during the upload process, receiving a progress value (0 to 1); the second one is called once the upload has completed, receiving the URL of the uploaded image; and the last one will be called if the upload has failed, receiving the error message. All callbacks are called from the main thread.

Giphy Beta and Production Key

The *Upload* method has two variants: one using Giphy's public beta key, and the other using your own channel username and production API key. The public beta key is meant to be used in development only. According to [Giphy Upload API documentation](#), it is "subject to rate limit constraints", and they "do not encourage live production deployments to use the public key". If you have created a Giphy channel and want to upload GIF images directly to that channel, you'll need to [request an Upload Production Key](#), then provide that key and your channel username to the *Upload* method.

We'll extend the above example, and modify the *OnGifExportCompleted* callback handler to upload the GIF image to Giphy once it is created. We'll demonstrate two cases: upload using the public beta key and upload using your own production key.

```
...  
  
// This callback is called once the GIF exporting has completed.  
// It receives a reference to the original clip and the filepath of the generated image.  
void OnGifExportCompleted(AnimatedClip clip, string path)
```

```

{
    Debug.Log("A GIF image has been created at " + path);

    // We've done using the clip, dispose it to save memory
    if (clip == myClip)
    {
        myClip.Dispose();
        myClip = null;
    }

    // The GIF image has been created, now we'll upload it to Giphy
    // First prepare the upload content
    var content = new GiphyUploadParams();
    content.localImagePath = path;      // the file path of the generated GIF image
    content.tags = "easy mobile, sglib games, unity";      // optional image tags, comma
-delimited
    content.sourcePostUrl = "YOUR_WEBSITE_ADDRESS";      // optional image source, e.g.
your website
    content.isHidden = false;      // optional hidden flag, set to true to mark the imag
e as private

    // Upload the image to Giphy using the public beta key
    UploadToGiphyWithBetaKey(content);
}

// This method uploads a GIF image to Giphy using the public beta key,
// no need to specify any username or API key here.
void UploadToGiphyWithBetaKey(GiphyUploadParams content)
{
    Giphy.Upload(content, OnGiphyUploadProgress, OnGiphyUploadCompleted, OnGiphyUpload
Failed);
}

// This method uploads a GIF image to your own Giphy channel,
// using your channel username and production key.
void UploadToGiphyWithProductionKey(GiphyUploadParams content)
{
    Giphy.Upload("YOUR_CHANNEL_USERNAME", "YOUR_PRODUCTION_KEY",
                content,
                OnGiphyUploadProgress,
                OnGiphyUploadCompleted,
                OnGiphyUploadFailed);
}

// This callback is called repeatedly during the uploading process.
// It receives a progress value ranging from 0 to 1.
void OnGiphyUploadProgress(float progress)
{
    Debug.Log(string.Format("Upload progress: {0:P0}", progress));
}

// This callback is called once the uploading has completed.
// It receives the URL of the uploaded image.

```

```

void OnGiphyUploadCompleted(string url)
{
    Debug.Log("The GIF image has been uploaded successfully to Giphy at " + url);
}

// This callback is called if the upload has failed.
// It receives the error message.
void OnGiphyUploadFailed(string error)
{
    Debug.Log("Uploading to Giphy has failed with error: " + error);
}

```

Display the Giphy Attribution Marks

To [request a Production Key](#), Giphy require you to display the "Powered by Giphy" attribution marks whenever their API is utilized in your app, and provide screenshots of your attribution placement when submitting for the key. To take care of this, we provide the static *IsUsingAPI* boolean property inside the *Giphy* class. This property will be true as long as Giphy API is in use, to let you know when to show their attribution marks. You can display the attribution logo using an Image or a Sprite object, then poll this property inside the Update() function, and activate or deactivate the object accordingly.

You can download Giphy's official attribution marks [here](#).

```

// Drag the object displaying the attribution marks to this field in the inspector
public GameObject attribution;

...

void Update()
{
    attribution.SetActive(Giphy.IsUsingAPI);
}

```

Share Giphy URLs

After uploading your GIF image to Giphy and obtain its URL, you can share this URL using the *ShareURL* method of the *MobileNativeShare* class. In the example below, we'll modify the *OnGiphyUploadCompleted* callback handler of the previous example to store the returned URL into a global variable, which can be used for later sharing.

```
...  
  
// Global variable to hold the Giphy URL of the uploaded GIF  
string giphyURL;  
  
...  
  
// This callback is called once the uploading has completed.  
// It receives the URL of the uploaded image.  
void OnGiphyUploadCompleted(string url)  
{  
    Debug.Log("The GIF image has been uploaded successfully to Giphy at " + url);  
  
    // Store the URL into our global variable  
    giphyURL = url;  
}  
  
...  
  
// This method shares the URL using the native sharing utility on iOS and Android  
public void ShareGiphyURL()  
{  
    if (!string.IsNullOrEmpty(giphyURL))  
    {  
        MobileNativeShare.ShareURL(giphyURL);  
    }  
}
```

PlayMaker Actions

The PlayMaker actions of the GIF module are group in the category *Easy Mobile - Gif* in the PlayMaker's Action Browser.

Please refer to the GifDemo_PlayMaker scene in folder
Assets/EasyMobile/Demo/PlayMakerDemo/Modules for an example on how these actions can be used.

In-App Purchasing

The In-App Purchasing module helps you quickly setup and sell digital products in your game. Here're some highlights of this modules:

- **Leverages Unity In-App Purchasing service**
 - This module is built on top of Unity IAP service, a powerful service that supports most app stores including iOS App Store, Google Play, Amazon Apps, Samsung GALAXY Apps and Tizen Store
 - Unity IAP is tightly integrated with the Unity engine, so compatibility and reliability can be expected
- **Easy management of product catalog**
 - Easy Mobile's custom editor features a friendly interface that helps you easily add, edit or remove products
- **Receipt validation**
 - Local receipt validation that offers extra security

Module Configuration

To use the In-App Purchasing module you must first enable it. Go to *Window > Easy Mobile > Settings*, select the In-App Purchasing tab, then click the right-hand side toggle to enable and start configuring the module.

Enable Unity IAP

The In-App Purchasing module requires Unity IAP service to be enabled. It will automatically check for the service's availability and prompt you to enable it if needed. Below is the module settings interface when Unity IAP is disabled.

To use Unity In-App Purchasing service, you must first [set up your project for Unity Services](#).

To enable Unity IAP service go to *Window > Services* and select the In-App Purchasing tab.

In the opened configuration window, click the toggle at the right-hand side or the *Enable* button to enable Unity IAP service.

A dialog window will appear asking a few questions about your game in order to ensure COPPA compliance.

Next click the *Import* button to import the Unity IAP package to your project.

After importing, there should be a UnityPurchasing folder added under Assets/Plugins folder.

Enabling Unity IAP service will automatically enable the Unity Analytics service (if it's not enabled before), this is a requirement to use Unity IAP. Go back to the Services panel and make sure that both In-App Purchasing and Analytics services are now enabled.

After enabling Unity IAP service, the settings interface of the In-App Purchasing module will be updated and ready for you to start configuring.

Target Android Store

If you're building for Android platform, you need to specify your target store. In the **[ANDROID] TARGET STORE** section select your target store from the dropdown.

Receipt Validation

The receipt validation feature provides extra security and helps prevent fraudulent users from accessing content they have not purchased. This feature employs Unity IAP's local receipt validation, which means the validation takes place on the target device, without the need to connect to a remote server.

Receipt validation is available for Apple stores and Google Play store. Please find more information about Unity IAP's receipt validation [here](#).

Obfuscating Encryption Keys

To enable receipt validation, you must first create obfuscated encryption keys. The purpose of this obfuscating process is to prevent a fraudulent user from accessing the actual keys, which are used for the validation process. To obfuscate your encryption keys, go to *Window > Unity IAP > Receipt Validation Obfuscator*.

In the opened **IAP Obfuscator** window, paste in your Google Play public key and hit the *Obfuscate secrets* button. According to Unity documentation, this will obfuscate both Apple's root certificate (bundle with Unity IAP) and the provided Google Play public key and create two C# files AppleTangle and GooglePlayTangle at *Assets/Plugins/UnityPurchasing/generated*. These files are required for the receipt validation process.

To obtain the Google Play public key for your app, login to your Google Play Developer Console, select your app, then navigate to the **Services & APIs** section and find your key under the section labeled **YOUR LICENSE KEY FOR THIS APPLICATION**.

Note that you don't need to provide a Google Play public key if you're only targeting Apple stores.

Enable Receipt Validation

After creating the obfuscated encryption keys, you can now enable receipt validation for your game. Open the In-App Purchasing module settings, then in the **RECEIPT VALIDATION** section check the corresponding options for your targeted stores.

Product Management

In the **PRODUCTS** section you can easily add, edit or remove your IAP products.

Add a New Product

To add a new product, click the *Add New Product* button.

The screenshot shows a light gray rectangular interface. At the top left, the word "PRODUCTS" is written in a bold, black, sans-serif font. Below it is a horizontal button with a thin gray border containing the text "No products added." in a smaller, regular black font. At the bottom center of the interface is another horizontal button with a thin gray border, this one labeled "Add New Product" in a regular black font.

A new empty product will be added.

The screenshot shows a "New Product" dialog box with a light gray background. On the left, there are three input fields: "Name" (empty), "Type" (set to "Consumable"), and "Id" (empty). To the right of these fields are three small buttons with arrows: an upward arrow, a downward arrow, and a minus sign. Below the "Name" field is a blue link labeled "► More (Optional)".

Fill in the required information for your new product:

- *Name*: the product name, can be used when making purchases
- *Type*: the product type, can be Consumable, Non-Consumable or Subscription
- *Id*: the unified product identifier, you should use this ID when declaring the product on your targeted stores; otherwise, if you need to have a different ID for this product on a certain store, add it to the *Store-Specific Ids* array (see below)

Click *More* if you need to enter store-specific IDs or fill in optional information for your product.

The screenshot shows the same "New Product" dialog box as before, but with a red rectangular box highlighting the "More (Optional)" section. This section contains two more input fields: "Price" (empty) and "Description" (empty). At the bottom of the dialog box is a section labeled "Store-Specific Ids" with a small input field containing the number "0".

- *Price*: the product price string for displaying purpose
- *Description*: the product description for displaying purpose

- **Store-Specific Ids:** if you need to use a different product ID (than the unified ID provided above) on a certain store, you can add it here

Adding Store-Specific ID

To add a new ID to the *Store-Specific Ids* array, increase the array size by adjusting the number in the right-hand side box. A new record will be added where you can select the targeted store and enter the corresponding product ID for that store.

Below is a sample product with all the information entered including the two store-specific IDs.

The screenshot shows a product configuration screen for a "Sample Product". The product details are as follows:

- Name:** Sample Product
- Type:** Consumable
- Id:** com.easymobile.sample_product
- More (Optional):**
 - Price:** \$1.99
 - Description:** This is sample consumable product
- Store-Specific Ids:** A table with two rows:

Apple App Store	com.easymobile.sample_product_ios
Amazon Apps	com.easymobile.sample_product_amazon

On the right side of the "Store-Specific Ids" table, there are three buttons: an upward arrow, a minus sign (-), and a downward arrow. The minus sign button is highlighted with a red box.

Remove a Product

To remove a product, simply click the [-] button at the right hand side.

The screenshot shows the same product configuration screen as before, but the "Store-Specific Ids" table now has only one row:

Apple App Store	com.easymobile.sample_product_ios
-----------------	-----------------------------------

The second row for Amazon Apps has been removed. The right-side buttons remain the same: upward arrow, minus sign (-), and downward arrow. The minus sign button is highlighted with a red box.

Arrange Product List

You can use the two arrow-up and arrow-down buttons to move a product upward or downward within the product list.

Setup Products for Targeted Stores

Beside creating the product list in Unity, you also need to declare similar products for your targeted stores, e.g. if you're targeting iOS App Store you need to create the products in iTunes Connect. If you're not familiar with the process, you can follow [Unity's instructions on configuring IAP for various stores](#), which also include useful information about IAP testing.

On Google Play store, both consumable and non-consumable products are defined as Managed product. If a product is set to Consumable type in Unity, the module will automatically handle the consumption of the product once it is bought and make it available for purchase again.

Constants Generation

Constants generation is a feature of the In-App Purchasing module. It reads all the product names and generates a static class named EM_IAPConstants that contains the constants of these names. Later, you can use these constants when making purchases in script instead of typing the product names directly, thus help prevent runtime errors due to typos and the likes.

To generate the constants class (you should do this after finishing with product editing), click the *Generate Constants Class* button within the **CONSTANTS CLASS GENERATION** section.

When the process completes, a file named EM_IAPConstants will be created at *Assets/EasyMobile/Generated*.

Scripting

This section provides a guide to work with the In-App Purchasing API.

You can access the In-App Purchasing module API via the `InAppPurchasing` class under the `EasyMobile` namespace.

Initialization

The module will automatically initialize Unity IAP at start without you having to do anything. All further API calls can only be made after the initialization has finished. You can check if Unity IAP has been initialized:

```
// Check if Unity IAP has been initialized  
bool isInitialized = InAppPurchasing.IsInitialized();
```

Obtain Product List

You can obtain the array of all products created in the module settings interface:

```
// Get the array of all products created in the In-App Purchasing module settings  
// IAPPProduct is the class representing a product as declared in the module settings  
IAPPProduct[] products = InAppPurchasing.GetAllIAPPProducts();  
  
// Print all product names  
foreach (IAPPProduct prod in products)  
{  
    Debug.Log("Product name: " + prod.Name);  
}
```

Make a Purchase

You can purchase a product using its name.

It is strongly recommended that you use the constants of product names in the generated `EM_IAPConstants` class (see **IAP Constants Generation** section) instead of typing the names directly in order to prevent runtime errors due to typos and the likes.

```
// Purchase a product using its name  
// EM_IAPConstants.Sample_Product is the generated name constant of a product named "S  
ample Product"  
InAppPurchasing.Purchase(EM_IAPConstants.Sample_Product);
```

A *PurchaseCompleted* event will be fired if the purchase is successful, otherwise, a *PurchaseFailed* event will be fired instead. You can listen to these events and take appropriate actions, e.g. grant the user digital goods if the purchase has succeeded.

```

// Subscribe to IAP purchase events
void OnEnable()
{
    InAppPurchasing.PurchaseCompleted += PurchaseCompletedHandler;
    InAppPurchasing.PurchaseFailed += PurchaseFailedHandler;
}

// Unsubscribe when the game object is disabled
void OnDisable()
{
    InAppPurchasing.PurchaseCompleted -= PurchaseCompletedHandler;
    InAppPurchasing.PurchaseFailed -= PurchaseFailedHandler;
}

// Purchase the sample product
public void PurchaseSampleProduct()
{
    // EM_IAPConstants.Sample_Product is the generated name constant of a product named "Sample Product"
    InAppPurchasing.Purchase(EM_IAPConstants.Sample_Product);
}

// Successful purchase handler
void PurchaseCompletedHandler(IAPPProduct product)
{
    // Compare product name to the generated name constants to determine which product was bought
    switch (product.Name)
    {
        case EM_IAPConstants.Sample_Product:
            Debug.Log("Sample_Product was purchased. The user should be granted it now.");
            break;
        case EM_IAPConstants.Another_Sample_Product:
            Debug.Log("Another_Sample_Product was purchased. The user should be granted it now.");
            break;
        // More products here...
    }
}

// Failed purchase handler
void PurchaseFailedHandler(IAPPProduct product)
{
    Debug.Log("The purchase of product " + product.Name + " has failed.");
}

```

Check for Product Ownership

You can check if a product is owned by specifying its name. A product is considered "owned" if its receipt exists and passes the receipt validation (if enabled).

```
// Check if the product is owned by the user  
// EM_IAPConstants.Sample_Product is the generated name constant of a product named "S  
ample Product"  
bool isOwned = InAppPurchasing.IsProductOwned(EM_IAPConstants.Sample_Product);
```

Consumable products' receipts are not persisted between app restarts, therefore this method only returns true for those products in the session they're purchased.

In the case of subscription products, this method simply checks if a product has been bought (subscribed) before and has a receipt. It doesn't check if the subscription is expired or not.

Restore Purchases

Non-consumable and subscription products are restorable. App stores maintain a permanent record of each user's non-consumable and subscription products, so that he or she can be granted these products again when reinstalling your game.

Apple normally requires a *Restore Purchases* button to exist in your game, so that the users can explicitly initiate the purchase restoration process. On other platforms, e.g. Google Play, the restoration is done automatically during the first initialization after reinstallation.

During the restoration process, a *PurchaseCompleted* event will be fired for each owned product, as if the user has just purchased them again. Therefore you can reuse the same handler to grant the user their products as normal purchases.

On iOS, you can initiate a purchase restoration as below.

```
// Restore purchases. This method only has effect on iOS.  
InAppPurchasing.RestorePurchases();
```

A *RestoreCompleted* event will be fired if the restoration is successful, otherwise, a *RestoreFailed* event will be fired instead. Note that these events only mean the success or failure of the restoration itself, while the *PurchaseCompleted* event will be fired for each restored product, as noted earlier. You can listen to these events and take appropriate actions, e.g. inform the user the restoration result.

The *RestoreCompleted* and *RestoreFailed* events are only raised on iOS.

```
// Subscribe to IAP restore events, these events are fired on iOS only.  
void OnEnable()  
{  
    InAppPurchasing.RestoreCompleted += RestoreCompletedHandler;  
    InAppPurchasing.RestoreFailed += RestoreFailedHandler;  
}  
  
// Successful restoration handler  
void RestoreCompletedHandler()  
{  
    Debug.Log("All purchases have been restored successfully.");  
}  
  
// Failed restoration handler  
void RestoreFailedHandler()  
{  
    Debug.Log("The purchase restoration has failed.");  
}  
  
// Unsubscribe  
void OnDisable()  
{  
    InAppPurchasing.RestoreCompleted -= RestoreCompletedHandler;  
    InAppPurchasing.RestoreFailed -= RestoreFailedHandler;  
}
```

Advanced Scripting

This section describes the methods to accomplish tasks beyond the basic ones such as making purchases or restoring. These tasks include retrieving product localized data, reading product receipts, refreshing receipts, etc.

Most of the methods described in this section are only available once Easy Mobile's IAP module and Unity IAP service are enabled, which is indicated by the definition of the symbol **EM_UIAP**. Therefore, you should always wrap the use of these methods inside a check for the existing of this symbol.

Also, the types exposed in these methods are only available when the Unity IAP package is imported, and you should include the `UnityEngine.Purchasing` and `UnityEngine.Purchasing.Security` namespaces at the top of your script for these types to be recognized.

Get Unity IAP's Product object

The in-app products are represented in Unity IAP by the Product class, which is different from Easy Mobile's IAPPProduct class, whose main purpose is for settings and displaying. This Product class is the entry point to access product-related data including its metadata and receipt, which is populated automatically by Unity IAP. To obtain the Product object of an in-app product, call the *GetProduct* method with the product name.

```
#if EM_UIAP
using UnityEngine.Purchasing;
#endif

...

// Obtain the Product object of the sample product and print its data
public void GetSampleProduct()
{
    #if EM_UIAP
        // EM_IAPConstants.Sample_Product is the generated name constant of a product named "Sample Product"
        Product sampleProduct = InAppPurchasing.GetProduct(EM_IAPConstants.Sample_Product)
;

        if (sampleProduct != null)
        {
            Debug.Log("Available To Purchase: " + sampleProduct.availableToPurchase.ToString());
            if (sampleProduct.hasReceipt)
            {
                Debug.Log("Receipt: " + sampleProduct.receipt);
            }
        }
    #endif
}
```

Get Product Localized Data

You can get a product's metadata retrieved from targeted app stores, e.g. localized title, description and price. This information is particularly useful when building a storefront in your game for displaying the in-app products. To get the localized data of a product, call the *GetProductLocalizedData* and specify the product name. The following example iterates through the product list and retrieve the localized data of each item.

```
#if EM_UIAP
using UnityEngine.Purchasing;
#endif

...
// Iterate through the product list and get the localized data retrieved from the targeted app store.
// Note the check for the EM_UIAP symbol.
void PrintProductsMetadata()
{
    #if EM_UIAP
    // Get all products created in the In-App Purchasing module settings
    IAPPProduct[] products = EM_Settings.InAppPurchasing.Products;

    foreach (IAPPProduct prod in products)
    {
        // Get product localized data.
        ProductMetadata data = InAppPurchasing.GetProductLocalizedData(prod.Name);

        if (data != null)
        {
            Debug.Log("Localized title: " + data.localizedTitle);
            Debug.Log("Localized description: " + data.localizedDescription);
            Debug.Log("Localized price string: " + data.localizedPriceString);
        }
    }
    #endif
}
```

Read Receipts

This section describes methods to work with receipts. Currently, Unity IAP only supports parsing receipts from Apple stores and Google Play store.

Note that for the receipt reading methods to work, you need to enable receipt validation feature (see the **Receipt Validation** section).

Apple App Receipt

On iOS, you can get the parsed Apple [App Receipt](#) for your app using the `GetAppleAppReceipt` method.

```
#if EM_UIAP
using UnityEngine.Purchasing;
using UnityEngine.Purchasing.Security;
#endif

...
// Read the App Receipt on iOS. Receipt validation is required.
void ReadAppleAppReceipt()
{
    #if EM_UIAP
    if (Application.platform == RuntimePlatform.IPhonePlayer)
    {
        AppleReceipt appReceipt = InAppPurchasing.GetAppleAppReceipt();

        // Print the receipt content.
        if (appReceipt != null)
        {
            Debug.Log("App Version: " + appReceipt.appVersion);
            Debug.Log("Bundle ID: " + appReceipt.bundleID);
            Debug.Log("Number of purchased products: " + appReceipt.inAppPurchaseReceipts.Length);
        }
    }
    #endif
}
```

Apple InAppPurchase Receipt

On iOS, you can get the parsed Apple InAppPurchase receipt for a particular product, using the *GetAppleIAPReceipt* method with the name of the product.

```
#if EM_UIAP
using UnityEngine.Purchasing;
using UnityEngine.Purchasing.Security;
#endif

...
// Read the InAppPurchase receipt of the sample product on iOS.
// Receipt validation is required.
void ReadAppleInAppPurchaseReceipt()
{
    #if EM_UIAP
    if (Application.platform == RuntimePlatform.IPhonePlayer)
    {
        // EM_IAPConstants.Sample_Product is the generated name constant of a product
        // named "Sample Product".
        AppleInAppPurchaseReceipt receipt = InAppPurchasing.GetAppleIAPReceipt(EM_IAPC
onstants.Sample_Product);

        // Print the receipt content.
        if (receipt != null)
        {
            Debug.Log("Product ID: " + receipt.productID);
            Debug.Log("Original Purchase Date: " + receipt.originalPurchaseDate.ToShort
DateString());
            Debug.Log("Original Transaction ID: " + receipt.originalTransactionIdentif
ier);
            Debug.Log("Purchase Date: " + receipt.purchaseDate.ToShortDateString());
            Debug.Log("Transaction ID: " + receipt.transactionID);
            Debug.Log("Quantity: " + receipt.quantity);
            Debug.Log("Cancellation Date: " + receipt.cancellationDate.ToShortDateString());
            Debug.Log("Subscription Expiration Date: " + receipt.subscriptionExpiratio
nDate.ToShortDateString());
        }
    }
    #endif
}
```

Google Play Receipt

On Android, you can get the parse GooglePlay receipt for a particular product, using the *GetGooglePlayReceipt* method with the name of the product.

```
#if EM_UIAP
using UnityEngine.Purchasing;
using UnityEngine.Purchasing.Security;
#endif

...
// Read the GooglePlay receipt of the sample product on Android.
// Receipt validation is required.
void ReadGooglePlayReceipt()
{
    #if EM_UIAP
    if (Application.platform == RuntimePlatform.Android)
    {
        // EM_IAPConstants.Sample_Product is the generated name constant of a product
        // named "Sample Product".
        GooglePlayReceipt receipt = InAppPurchasing.GetGooglePlayReceipt(EM_IAPConstan
ts.Sample_Product);

        if (receipt != null)
        {
            Debug.Log("Package Name: " + receipt.packageName);
            Debug.Log("Product ID: " + receipt.productID);
            Debug.Log("Purchase Date: " + receipt.purchaseDate.ToShortDateString());
            Debug.Log("Purchase State: " + receipt.purchaseState.ToString());
            Debug.Log("Transaction ID: " + receipt.transactionID);
            Debug.Log("Purchase Token: " + receipt.purchaseToken);
        }
    }
    #endif
}
```

Refresh Apple App Receipt

Apple provides a mechanism to fetch a new App Receipt from their servers, typically used when no receipt is currently cached in local storage [SKReceiptRefreshRequest](#). You can refresh the App Receipt on iOS using the *RefreshAppleAppReceipt* method. Note that this will prompt the user for their password.

```
// Fetch a new Apple App Receipt on iOS. This will prompt the user for their password.  
void RefreshAppleAppReceipt()  
{  
    if (Application.platform == RuntimePlatform.IPhonePlayer)  
    {  
        InAppPurchasing.RefreshAppleAppReceipt(SuccessCallback, ErrorCallback);  
    }  
}  
  
void SuccessCallback(string receipt)  
{  
    Debug.Log("App Receipt refreshed successfully. New receipt: " + receipt);  
}  
  
void ErrorCallback()  
{  
    Debug.Log("App Receipt refreshing failed.");  
}
```

PlayMaker Actions

The PlayMaker actions of the In-App Purchasing module are group in the category *Easy Mobile - In-App Purchasing* in the PlayMaker's Action Browser.

Please refer to the InAppPurchasingDemo_PlayMaker scene in folder
Assets/EasyMobile/Demo/PlayMakerDemo/Modules for an example on how these
actions can be used.

In App Purchasing_Get All Products

Returns arrays of names, IDs and types of all in-app products. Each product is referenced by the same index in all resulted arrays.

Result

Product Count	<input type="text" value="None"/>
Product Names	<input type="text" value="None"/>
Product Ids	<input type="text" value="None"/>
Product Types	<input type="text" value="None"/>
Price Strings	<input type="text" value="None"/>
Descriptions	<input type="text" value="None"/>

Preview Add Action To State

Sharing

The Sharing module helps you easily share texts and images to social networks including Facebook, Twitter and Google+ using the native sharing functionality. In addition, it also provides convenient methods to capture the screenshots to be shared.

Below are the sharing interfaces on iOS and Android, respectively.

[iOS] Request Photo Library Access Permission

Since iOS 10, in order to use the "Save Image" feature of the sharing utility, the app needs to ask for user permission before it can access the photo library. Failure to do so will cause the app to crash as soon as the user selects the option. To request the photo library access

permission, you need to add the **Privacy - Photo Library Usage Description** and **Privacy - Photo Library Additions Usage Description** properties to the Info.plist of your Xcode project.

As of this writing, our tests show that on iOS 10, the **Privacy - Photo Library Usage Description** property is required. While iOS 11 asks for the **Privacy - Photo Library Additions Usage Description** property. Therefore it's recommended to add both properties if your target platforms including iOS 10 and above.

In your generated Xcode project open the Info.plist file.

Click the + button on the right of **Information Property List** to add a new key.

Key	Type	Value
▼ Information Property List	Dictionary (26 items)	
Localization native development region	String	en
Bundle display name	String	EM Demo
Executable file	String	\$(EXECUTABLE_NAME)
► Icon files	Array (7 items)	
Bundle identifier	String	com.sgilb.\$(PRODUCT_NAME)
InfoDictionary version	String	6.0
Bundle name	String	\$(PRODUCT_NAME)
Bundle OS Type code	String	APPL
Bundle versions string, short	String	1.0
Bundle version	String	0
Application requires iPhone environment	Boolean	YES

Scroll down to find the **Privacy - Photo Library Usage Description** key.

Key	Type	Value
Information Property List		
Privacy - Photo Library Usage Description	String	For saving screenshots to photo library
Privacy - Photo Library Usage Description	String	en
Privacy - Reminders Usage Description	String	EM Demo
Privacy - Siri Usage Description	String	\${EXECUTABLE_NAME}
► Privacy - Speech Recognition Usage Description	Array	(7 items)
Privacy - TV Provider Usage Description	String	com.sglib.\${PRODUCT_NAME}
Privacy - Video Subscriber Account Usage Description	String	6.0
Quick Look needs to be run in main thread	String	\${PRODUCT_NAME}
Quick Look preview height	String	APPL
Quick Look preview width	String	1.0
Quick Look supports concurrent requests	String	0
Application requires iPhone environment	Boolean	YES

Enter a value for the key, this message will be displayed as the app requests access permission when the user selects the "Save Image" option.

Key	Type	Value
Information Property List		
Privacy - Photo Library Usage Description	String	For saving screenshots to photo library
Localization native development region	String	en
Bundle display name	String	EM Demo
Executable file	String	\${EXECUTABLE_NAME}

Bundle version	String	0
Application requires iPhone environment	Boolean	YES

[Android] Enable External Write Permission

For this module to function on Android, it is necessary to enable the permission to write to external storage. To do so, go to *Edit > Project Settings > Player*, select *Android settings* tab, then locate the **Configuration** section and set the *Write Permission* to *External (SDCard)*.

Scripting

This section provides a guide to work with Sharing API.

You can access the Sharing module API via the Sharing class under the EasyMobile namespace.

Capture Screenshots

To capture the device's screenshot, you have a few options.

Capture and Save a Screenshot as PNG Image

To capture and save a screenshot of the whole device screen, simply specify the file name to be saved. This screenshot will be saved as a PNG image in the directory pointed by [Application.persistentDataPath](#). Note that this method, as well as other screenshot capturing methods, needs to be called at the end of a frame (when the rendering has done) for it to produce a proper image. Therefore you should call it within a coroutine after [WaitForEndOfFrame\(\)](#).

```
// Coroutine that captures and saves a screenshot
IEnumerator SaveScreenshot()
{
    // Wait until the end of frame
    yield return new WaitForEndOfFrame();

    // The SaveScreenshot() method returns the path of the saved image
    // The provided file name will be added a ".png" extension automatically
    string path = Sharing.SaveScreenshot("screenshot");
}
```

You can also captures and saves just a portion of the screen:

```
// Coroutine that captures and saves a portion of the screen
IEnumerator SaveScreenshot()
{
    // Wait until the end of frame
    yield return new WaitForEndOfFrame();

    // Capture the portion of the screen starting at (50, 50),
    // has a width of 200 and a height of 400 pixels.
    string path = Sharing.SaveScreenshot(50, 50, 200, 400, "screenshot");
}
```

Capture a Screenshot into a Texture2D

In some cases you may want to capture a screenshot and obtain a Texture2D object of it instead of saving to disk, e.g. to create a sprite from the texture and display it in-game.

```
// Coroutine that captures a screenshot and generates a Texture2D object of it
IEnumerator CaptureScreenshot()
{
    // Wait until the end of frame
    yield return new WaitForEndOfFrame();

    // Create a Texture2D object of the screenshot using the CaptureScreenshot() method
    Texture2D texture = Sharing.CaptureScreenshot();
}
```

Similar to the case above, you can also capture only a portion of the screen.

```
// Coroutine that captures a portion of the screenshot and generates a Texture2D object of it
IEnumerator CaptureScreenshot()
{
    // Wait until the end of frame
    yield return new WaitForEndOfFrame();

    // Create a Texture2D object of the screenshot using the CaptureScreenshot() method
    // The captured portion starts at (50, 50) and has a width of 200, a height of 400 pixels.
    Texture2D texture = Sharing.CaptureScreenshot(50, 50, 200, 400);
}
```

Note that screenshot capturing should be done at the end of the frame.

Sharing

To share an image you also have a few options. You can also attach a message to be shared with the image.

Due to Facebook policy, pre-filled messages will be ignored when sharing to this network, i.e. sharing messages must be written by the user.

Share a Saved Image

You can share a saved image by specifying its path.

```
// Share a saved image
// Suppose we have a "screenshot.png" image stored in the persistentDataPath,
// we'll construct its path first
string path = System.IO.Path.Combine(Application.persistentDataPath, "screenshot.png")
;

// Share the image with the path, a sample message and an empty subject
Sharing.ShareImage(path, "This is a sample message");
```

Share a Texture2D

You can also share a Texture2D object obtained some point before the sharing time. Internally, this method will also create a PNG image from the Texture2D, save it to the persistentDataPath, and finally share that image.

```
// Share a Texture2D
// sampleTexture is a Texture2D object captured some time before
// This method saves the texture as a PNG image named "screenshot.png" in persistentDataPath,
// then shares it with a sample message and an empty subject
Sharing.ShareTexture2D(sampleTexture, "screenshot", "This is a sample message");
```

Share a Text

You can share a text-only message using the *ShareText* method. Note that Facebook doesn't allow pre-filled sharing messages, so the text will be discarded when sharing to this particular network.

```
// Share a text
Sharing.ShareText("Hello from Easy Mobile!");
```

Share a URL

To share a URL, use the *ShareURL* method. On networks like Facebook or Twitter, a summary of the page will be shown if the shared URL points to a website. URLs are also useful to share GIF images hosted on sites like [Giphy](#) (see the *GIF > Scripting* section).

```
// Share a URL
Sharing.ShareURL("www.sglibgames.com");
```

PlayMaker Actions

The PlayMaker actions of the Sharing module are group in the category *Easy Mobile - Sharing* in the PlayMaker's Action Browser.

Please refer to the SharingDemo_PlayMaker scene in folder
Assets/EasyMobile/Demo/PlayMakerDemo/Modules for an example on how these actions can be used.

The screenshot shows the PlayMaker Actions window with the following details:

- Actions** tab is selected.
- Mobile Native Share_Capture Screenshot** is selected in the list.
- Description:** Captures a screenshot into a Texture2D object and returns it.
- Result:**
 - Screenshot:** Set to **None (Texture)**. A **Select** button is available.
- Capture Area:**
 - Start X:** 0
 - Start Y:** 0
 - Width:** 100
 - Height:** 100
- Preview:**
- Add Action To State:** Button.

Native APIs

The Native APIs module allows access to mobile native functionalities. The first feature available is native UI. More functionalities will be added soon.

Native UI

The Native UI feature allows you to access native mobile UI elements including alerts and (Android) toasts.

Alerts

Alerts are useful in providing the users contextual information, asking for confirmation or prompting them to make a selection out of several options. An alert can have one, two or three buttons with it.

Below are the three types of alert on iOS.

And below are the three types of alert on Android.

Toasts

Toasts are short messages displayed at the bottom of the screen. They automatically disappear after a timeout. Toasts are available on Android only. Below is a sample toast message.

Development Guide

Scripting

This section provides a guide to work with Native UI API.

You can access the Native UI API via the NativeUI class under the EasyMobile namespace.

Alerts

Alerts are available on both iOS and Android platform and can have up to three buttons.

Simple (one-button) alerts are useful in giving the user contextual information. To show a simple alert with the default OK button, you only need to provide a title and a message for the alert:

```
// Show a simple alert with OK button
NativeUI.AlertPopup alert = NativeUI.Alert("Sample Alert", "This is a sample alert with an OK button.");
```

You can also show a one-button alert with a custom button label.

```
// Show an alert with a button labeled as "Got it"
NativeUI.AlertPopup alert = NativeUI.Alert(
    "Sample Alert",
    "This is a sample alert with a custom button.",
    "Got it"
);
```

Two-button alerts can be useful when needing to ask for user confirmation. To show a two-button alert, you need to specify the labels of these two buttons.

```
// Show a two-button alert with the buttons labeled as "Button 1" & "Button 2"
NativeUI.AlertPopup alert = NativeUI.ShowTwoButtonAlert(
    "Sample Alert",
    "This is a two-button alert.",
    "Button 1",
    "Button 2"
);
```

Three-button alerts can be used to present the user with several options, a typical usage of it is to implement the Rate Us popup. To show a three-button alert, you need to specify the labels of the three buttons.

```
// Show a three-button alert with the buttons labeled as "Button 1", "Button 2" & "Button 3"
NativeUI.AlertPopup alert = NativeUI.ShowThreeButtonAlert(
    "Sample Alert",
    "This is a three-button alert.",
    "Button 1",
    "Button 2",
    "Button 3"
);
```

Whenever an alert is shown, a *NativeUI.AlertPopup* object is returned, when the alert is closed, this object will fire an *OnComplete* event and then destroy itself. The argument of this event is the index of the clicked button. You should listen to this event and take appropriate action depending on the button selected.

```
// Show a three button alert and handle its OnComplete event
NativeUI.AlertPopup alert = NativeUI.ShowThreeButtonAlert(
    "Sample Alert",
    "This is a three-button alert.",
    "Button 1",
    "Button 2",
    "Button 3"
);

// Subscribe to the event
if (alert != null)
{
    alert.OnComplete += OnAlertCompleteHandler;
}

// The event handler
void OnAlertCompleteHandler(int buttonIndex)
{
    switch (buttonIndex)
    {
        case 0:
            // Button 1 was clicked
            break;
        case 1:
            // Button 2 was clicked
            break;
        case 2:
            // Button 3 was clicked
            break;
        default:
            break;
    }
}
```

Only one alert popup can be shown at a time. Any call to show an alert while another one is being displayed will be ignored. You can check if an alert is being shown using the *IsShowingAlert* method.

```
// Check if an alert is being displayed.  
bool isShowingAlert = NativeUI.IsShowingAlert();
```

Toasts

Toast is a short message displayed at the bottom of the screen and automatically disappears after a timeout. Toasts are available only on Android platform. To show a toast message:

```
// Show a sample toast message  
NativeUI.ShowToast("This is a sample Android toast");
```

PlayMaker Actions

The PlayMaker actions of the Native APIs module are group in the category *Easy Mobile - Native APIs* in the PlayMaker's Action Browser.

Please refer to the NativeUIDemo_PlayMaker scene in folder
Assets/EasyMobile/Demo/PlayMakerDemo/Modules for an example on how Native UI actions can be used.

The screenshot shows the PlayMaker Actions window with the following interface:

- Actions Bar:** A search bar at the top left and a gear icon for settings.
- Category Tree:** A tree view on the left showing categories like Color, Convert, Debug, Device, and various Easy Mobile sub-categories.
- Selected Action:** "Mobile Native UI_Alert" is highlighted with a blue selection bar.
- Description:** Below the selection bar, it says "Shows a native one-button alert."
- Properties:** A table of properties with dropdown menus:
 - Title:** [empty input]
 - Message:** [empty input]
 - Button Label:** OK
 - Result:**
 - Event Target:** Self
 - On Complete Event:** [empty input]
 - Button Index:** None
- Buttons:** At the bottom left is a checked checkbox labeled "Preview". At the bottom right is a button labeled "Add Action To State".

Notifications

The Notifications module helps you quickly implement notifications feature in your app.

Here're some highlights of this module:

- **Remote (push) notification**

- The module is currently compatible with [OneSignal](#), a free, popular cross-platform push notification delivery service.

- **Local notification**

- One-time and repeat notifications.
- Fully-customizable notifications: sounds, icons, badge, light, vibration, lock-screen visibility, etc. (feature availability varies between iOS and Android)
- Supports notification custom action buttons.

- **Notification Category**

- Unifies Android notification category (channel) and iOS notification category, makes it easy to customize and organize notifications in your app.
- Fully supports notification channels introduced and required since Android O, while maintaining backward-compatibility with older Android versions, where notification channels don't exist.
- Fully supports notification channel groups introduced since Android O.

- **Friendly editor**

- Makes it easy to setup remote notification service, manage categories, adding resources, etc.

Easy Mobile's notification API works on iOS 10 or newer ([93% of devices by Jan 2018](#)) and Android API 14 or newer ([99.37% of devices by Feb 2018](#)).

A Brief Introduction of Notifications

A notification is basically a message that is displayed by the system outside of your app's UI to provide the user with some timely information about your app. The user can open a notification to bring your app to foreground and take further actions if they wish.

If your app is in foreground at the moment the notification is delivered, then the notification won't be posted (in other words, it will be silenced). Instead, its data will be sent to the app directly in form of an event.

Notifications appear to users in different locations and formats, plus their appearance varies slightly between iOS and Android, and among different versions of these platforms.

Depending on the current state of your device, notifications can appear in the status bar (Android), the notification center (iOS), or the lock-screen. Below are the typical anatomies of iOS and Android notifications.

iOS Notification Anatomy

Here's a typical iOS notification with basic details.

1. *Small icon*: provided by the system
2. *App name*: provided by the system
3. *Title*: the notification title provided by you
4. *Subtitle*: the optional notification subtitle provided by you
5. *Body*: the main notification message provided by you

Android Notification Anatomy

Here's a typical Android notification with basic details.

1. *Small icon*: required, provided by you (if no valid icon specified, Easy Mobile automatically uses the fallback icon, which is a bell)
2. *App name*: provided by the system
3. *Time stamp*: provided by the system
4. *Large icon*: optional, provided by you (this is usually used only for contact photos; do

- not use it for your app icon)
- 5. *Title*: the notification title provided by you
- 6. *Body*: the main notification message provided by you

You can learn more about iOS notifications [here](#) and Android notifications [here](#).

Notification Custom Actions

Beside basic content, you can optionally attach additional action buttons to the notification for specific tasks. Using unique action IDs, your app can acknowledge the action selected by the user and respond accordingly, e.g. open a particular UI for the user to perform further interaction.

A notification on iOS can have up to 4 action buttons. However, the number of actions actually displayed depends on how and where the notification is displayed. For example, banners display no more than two actions. Here's an example of an iOS notification with 2 action buttons, Action A and Action B.

A notification on Android can have up to 3 action buttons. Here's a typical Android notification with 2 action buttons, REPLY and ARCHIVE.

On Android, Easy Mobile supports notification actions on API 23 or newer.

Local Vs. Remote Notifications

Local notifications are notifications scheduled by your app locally. Your app configures the notification content, specifies a trigger condition, and passes these details to the system, which then handles the delivery of the notification when the trigger condition is met.

One-time vs. Repeat local notifications

A one time notification is delivered only once. A repeat notification is delivered once every time the repeat interval passed. Both notification types survive device reboots. If the delivery time is past at the moment the device has finished reboot, the notification will be delivered immediately.

Remote notifications are sent (pushed) to user devices from a remote server (be it your own server or a 3rd party server like OneSignal's) via the Apple Push Notification service (APNs) on iOS, or the Google Cloud Messaging service (GCM) on Android.

Notification Categories

Easy Mobile's cross-platform notification category unifies Android notification channel/category and iOS notification category, providing a simple and convenient way to customize and organize notifications in your app. You can use category to control multiple aspects of notifications including importance, light, vibration, sound and action buttons (configuration varies between platforms, e.g. importance and light are Android-only). All notifications posted to the same category share the same customization. Every time you schedule a notification, simply set the category it belongs to and all the settings of that category will be applied to the notification automatically. Using categories is therefore a more intuitive and efficient way to customize and organize notifications. You can have multiple categories in your app, each controls a different type of notifications. For example, you can have a category dedicated for game event notifications, and another category for user (chat) message notifications.

Notification Categories on iOS

On iOS, cross-platform categories automatically translate to native notification categories, taking only the information on custom actions because iOS notification categories are mostly responsible for configuring custom actions. About the other settings of the cross-platform category, those are applicable on iOS (e.g. sound) will automatically be applied when a notification of this category is scheduled.

iOS notification categories are not visible to users. You can learn more about them [here](#).

Notification Categories on Android

On Android 8.0 Oreo (API level 26), a new feature is introduced which is notification channels/categories. Starting in this version, all notifications must be assigned to a channel or it will not appear. Notification channels offer the ability to group notifications, and allow

users to control the visual and auditory options of each channel from the Android system settings.

The Android user interface refers to channels as "categories".

On Android 8.0 and newer, Easy Mobile's cross-platform notification categories automatically translate to native notification channels. Most settings are applicable to Android channels, except the custom actions (Android notification channels are not responsible for custom actions). When a local notification is scheduled, it will be assigned to the native notification channel, and the custom actions (if any) found in its cross-platform category are automatically added when constructing the notification.

On Android 7.1 (API level 25) and lower, there're no notification channels. When a local notification is scheduled, individual settings will be read from its cross-platform category and applied automatically when constructing the notification.

You can learn more about Android notification channels/categories [here](#).

Default Notification Category

For notifications to work consistently across iOS and Android platform, your app requires at least one notification category. Easy Mobile has a built-in default category. If you're scheduling a local notification and not specifying any category, then the default one will be used. This default category can be customized from the module settings, but it cannot be removed.

Notification Category Groups

You can organize your notification categories into category groups. On Android category groups directly translate to native channel groups. Below is an example of how notification channels are organized into groups in the system settings on Android.

Notification category groups don't have any effect on iOS.

Module Configuration

To use the Notifications module you must first enable it. Go to *Window > Easy Mobile > Settings*, select the Notifications tab, then click the right-hand side toggle to enable and start configuring the module.

Auto Initialization

Auto initialization is a feature of the Notifications module that initializes the service automatically when the module starts. You can configure this feature in the **AUTO-INIT CONFIG** section.

On iOS, a popup will appear during the first initialization following the app installation to ask for the user's permission to enable notifications for your game.

- *Auto Init*: uncheck this option to disable the auto initialization feature, you can start the initialization manually from script (see **Scripting** section)
- *Auto Init Delay*: how long after the module start that the initialization should take place

"Module start" refers to the moment the *Start* method of the module's associated MonoBehavior (attached to the EasyMobile prefab) runs. If you add the EasyMobile prefab instance to the first scene of your game then this moment is mostly identical to the launch time of the app.

Remote Notification Setup

Enable Remote Notifications

To enable remote/push notifications for your app, select a valid service provider from the *Push Notification Service* dropdown in **REMOTE NOTIFICATION SETUP** section. Currently only OneSignal service is supported, but more are to be added.

Setup OneSignal Push Notification Service

Before You Begin

Before setting up OneSignal in Unity, you must first generate appropriate credentials for your targeted platforms. If you're not familiar with the process, please follow the guides listed [here](#). You should also follow the instructions included in that document on performing necessary setup when building for each platform.

Using OneSignal service requires the [OneSignal plugin for Unity](#). Easy Mobile will automatically check for the availability of the plugin and prompt you to import it if needed (see the above screenshot). You can click the *Download OneSignal Plugin* button to open the download page for the plugin. Once it is imported into Unity the settings interface will be updated and ready for you to start configuring.

In fact all you need to do is enter your *OneSignal App Id*.

Adding Notification Resources

Android Notification Resources

Android notification resources include notification icons and custom notification sounds.

- **Custom notification sounds:** if you don't want to use the system's default notification sound, you can provide custom sounds to be played when your notifications are delivered.
- **Small notification icons:** small icons or status bar icons are required and will be used to represent notifications from your app in the status bar. Starting with Android 5, the system forces small notification icons to be all white when your app targets Android API 21+. If you don't make a correct icon, it will most likely be displayed as the fallback icon (bell) or solid white icon in the status bar.
- **Large notification icons:** large notifications icons are optional and will show up at different positions on the notification depending on the Android version (see below screenshot). If you do not specify a large icon, the small icon will be used.

Preparing Android Notification Icons

It's advisable to use the [Android Asset Studio](#) to quickly and easily generate small icons with the correct settings. Note that the default small icons must be named **ic_stat_em_default** so that Easy Mobile can recognize it. Below is an example of a *res* folder containing the default small icons generated by the Android Asset Studio. Later we will import this folder to Unity so that the icons can be used in your project.

If you want to have a default large icon, create a 256x256 icon, name it **ic_large_em_default** and place it in the *drawable-xxxhdpi* folder of the same *res* folder generated previously.

Non-Default Notification Icons

Beside the default icons, you can add more custom icons which can be used when scheduling different types of notifications. Just use the Android Asset Studio to generate small icons, and create large icons at the correct sizes (256x256). Then merge them into the same `res` folder that contains the default icons, making sure the icons go into their correct subfolders. When scheduling a notification, you can select these custom icons using their names.

Preparing Android Notification Sounds

To add custom notification sounds, create a folder named `raw` inside the `res` folder that contains the default notification icons and place the sound files there. Later these custom sounds can be specified in your project with their names. Below is an example `res` folder that contains default icons, custom icons and custom sounds for Android notifications.

Importing Android Notification Resources

After constructing the `res` folder with all the required icons and sounds, the next step is import the folder into your Unity project so the resources can be used in your app. In the **ANDROID NOTIFICATION RESOURCES** section, click the *Import Res Folder* button, then select the generated `res` folder to import. That's it!

iOS Notification Resources

On iOS, notification icons are provided by the system, but you can still have custom notification sounds. To add a custom sound to your iOS app, simply place the sound file anywhere in your Unity project, build your project for iOS platform, and then drag the sound file to the Xcode project root (remember to select *Copy items if needed* on the Xcode import dialog).

Notes on Notification Sounds

- It's recommended to have notification sounds in .wav format so that they can be used on both Android and iOS.
- Make sure sound names are consistent across iOS and Android.
- Notification sounds must be less than 30 seconds to make sure they can be played on both Android and iOS.

Category Management

Notification Category Groups

In the **CATEGORY GROUPS** section you can add, edit or remove groups for the notification categories in your app.

1. *Group content*: where you fill in group information
2. *Add button*: use this button to add a new group
3. *Move up button*: move the group up, for arrangement purpose
4. *Delete button*: use this button to remove the current group
5. *Move down button*: move the group down, for arrangement purpose

A category group content includes following fields:

- *Name*: the group name, must not be empty
- *Id*: the group ID, must not be empty; a category specifies the group it belongs to using this ID

Notification Categories

You can manage the notification categories in your app within the **CATEGORIES** section.

CATEGORIES

! Categories (also called channels on Android) provide a unified system to manage and customize notifications. All notifications posted to a category share the same customization defined by that category.

Default Category

Your app must have at least one category. You can modify the default category but not remove it.

Default	
Name	Default
Id	notification.category.default
Description	This is default category.
Group Id	[None]
Enable Badge	<input checked="" type="checkbox"/>
Importance	Default
Lights	Default
Vibration	Default
Lock Screen Visibility	Public
Sound	Default
Action Buttons	0

User Categories

► 2 User Categories

[Add New Category](#)

A category content includes following fields:

- *Name*: category name, only visible on Android devices, this is required
- *Id*: category ID, this is required; a notification specifies the category it belongs to using this ID
- *Description*: optional category description, only visible on Android devices
- *Group Id*: the identifier of the group this category belongs to
- *Enable Badge*: [Android only] whether the notifications of this category can appear as badges in a Launcher application
- *Importance*: [Android only] how much interruptive - visually and audibly - the notifications of this category should be
- *Lights*: [Android only] determines how the notification light should be displayed, on devices that support this feature
- *Light Color*: [Android only] the color of the notification light, only configurable when *Lights* is set to *Custom*
- *Vibration*: [Android only] determines how the device should vibrate when a notification arrives
- *Vibration Pattern*: [Android] the vibration pattern of the device, only configurable when *Vibration* is set to *Custom*
- *Lock-screen Visibility*: [Android only] determines how notifications should be displayed on lock-screen
- *Sound*: determine whether the default sound, or a custom sound, or no sound at all should be played when a notification arrives

- **Sound Name:** the filename (with extension) of the custom notification sound, only configurable if Sound is set to Custom
- **Action buttons:** the custom action buttons to be attached to the notifications of this category, each action button requires the following fields:
 - *Id:* action ID, used to distinguish between actions
 - *Title:* action title, used to display the action button on the notification

Default Category

Your app must have at least one notification category, and Easy Mobile provides a built-in default category. You can customize it in the **Default Category** sub-section of the **CATEGORIES** section. You can't remove the default category.

User Categories

Beside the default category, you can add as many more categories as you wish. We call these user categories, and they can be managed in the **User Categories** sub-section of the **CATEGORIES** section.

1. **Category content:** where you fill in category information
2. **Add button:** use this button to add a new user category
3. **Move up button:** move the category up, for arrangement purpose
4. **Delete button:** use this button to remove the current user category
5. **Move down button:** move the category down, for arrangement purpose

Constants Generation

Constants generation is a feature of the Notifications module. It reads the IDs of all user categories added and generates a static class named EM_NotificationsConstants that contains the constants of these IDs. Later, you can use these constants when scheduling a local notification in script instead of typing the IDs directly, thus help prevent runtime errors due to typos and the likes.

To generate the constants class (you should do this after adding all required user categories), click the *Generate Constants Class* button within the **CONSTANTS CLASS GENERATION** section.

When the process completes, a file named EM_NotificationsConstants will be created at *Assets/EasyMobile/Generated*.

Scripting

This section provides a guide to work with the Notifications API.

You can access the Notifications module API via the `Notifications` class under the `EasyMobile` namespace.

Initialization

Before notifications can be used, the module needs to be initialized. This initialization should only be done once when the app is loaded, and before any other calls to the API are made. If you have enabled the Auto initialization feature (see **Module Configuration** section), you don't need to start the initialization from script. Otherwise, if you choose to disable that feature, you can initialize the service using the `Init` method.

```
// Initialize push notification service
Notifications.Init();
```

Note that the initialization should be done early and only once, e.g. you can put it in the `Start` method of a `MonoBehaviour`, preferably a singleton so that it won't run again when the scene reloads.

```
// Initialization in the Start method of a MonoBehaviour script
void Start()
{
    // Initialize push notification service
    Notifications.Init();

    // Do other stuff...
}
```

You can check if the module has been initialized at any point using the `IsInitialized` method.

```
// Check if initialization has completed.
bool isInitialized = Notifications.IsInitialized();
```

Working with Local Notifications

Constructing a Notification Content

Before scheduling a notification, you must first prepare its content. To do this simply create a new *NotificationContent* object and fill it with appropriate information.

```
// Construct the content of a new notification for scheduling.  
NotificationContent PrepareNotificationContent()  
{  
    NotificationContent content = new NotificationContent();  
  
    // Provide the notification title.  
    content.title = "Demo Notification";  
  
    // You can optionally provide the notification subtitle, which is visible on iOS only.  
    content.subtitle = "Demo Subtitle";  
  
    // Provide the notification message.  
    content.body = "This is a demo notification.";  
  
    // You can optionally attach custom user information to the notification  
    // in form of a key-value dictionary.  
    content.userInfo = new Dictionary<string, object>();  
    content.userInfo.Add("string", "OK");  
    content.userInfo.Add("number", 3);  
    content.userInfo.Add("bool", true);  
  
    // You can optionally assign this notification to a category using the category ID  
    .  
    // If you don't specify any category, the default one will be used.  
    // Note that it's recommended to use the category ID constants from the EM_NotificationsConstants class  
    // if it has been generated before. In this example, UserCategory_notification_cat  
    egory_test is the  
    // generated constant of the category ID "notification.category.test".  
    content.categoryId = EM_NotificationsConstants.UserCategory_notification_category_  
test;  
  
    // If you want to use default small icon and large icon (on Android),  
    // don't set the smallIcon and largeIcon fields of the content.  
    // If you want to use custom icons instead, simply specify their names here (without  
    // file extensions).  
    content.smallIcon = "YOUR_CUSTOM_SMALL_ICON";  
    content.largeIcon = "YOUR_CUSTOM_LARGE_ICON";  
  
    return content;  
}
```

Scheduling Local Notifications

To schedule a local notification, prepare the notification content and feed it to the *ScheduleLocalNotification* method.

One-Time Local Notifications

You can schedule a notification to be delivered at a specific time (in the future). If the specified time is in the past, the notification will be delivered immediately.

```
using System; // for DateTime

...

// Schedule a notification to be delivered by 08:08AM, 08 August 2018.
void ScheduleLocalNotification()
{
    // Prepare the notification content (see the above section).
    NotificationContent content = PrepareNotificationContent();

    // Set the delivery time.
    DateTime triggerDate = new DateTime(2018, 08, 08, 08, 08);

    // Schedule the notification.
    Notifications.ScheduleLocalNotification(triggerDate, content);
}
```

Instead of a trigger date, you can also schedule a one-time notification to be delivered after some delay time.

```
using System;

...

// Schedule a notification to be delivered after 08 hours, 08 minutes and 08 seconds.
void ScheduleLocalNotification()
{
    // Prepare the notification content (see the above section).
    NotificationContent content = PrepareNotificationContent();

    // Set the delay time as a TimeSpan.
    TimeSpan delay = new TimeSpan(08, 08, 08);

    // Schedule the notification.
    Notifications.ScheduleLocalNotification(delay, content);
}
```

Repeat Local Notifications

If you want the notification to repeat automatically, schedule it to be delivered after some delay time, and then specify a fixed repeat interval. Repeat interval can be one of the following values:

- *None*: no repeat

- *EveryMinute*: notification repeats once every minute
- *EveryHour*: notification repeats once every hour
- *EveryDay*: notification repeats once every day
- *EveryWeek*: notification repeats once every week

```
using System;

...

// Schedule a notification to be delivered after 08 hours, 08 minutes and 08 seconds,
// then repeat once every day.
void ScheduleRepeatLocalNotification()
{
    // Prepare the notification content (see the above section).
    NotificationContent content = PrepareNotificationContent();

    // Set the delay time as a TimeSpan.
    TimeSpan delay = new TimeSpan(08, 08, 08);

    // Schedule the notification.
    Notifications.ScheduleLocalNotification(delay, content, NotificationRepeat.EveryDa
y);
}
```

Managing Pending Local Notifications

Get Pending Local Notifications

To get all pending (scheduled but not yet delivered) local notifications, use the *GetPendingLocalNotifications* method. The pending notifications will be returned as an array of *NotificationRequest* objects via a callback. Each pending notification request is identified by its request ID.

```
// Gets all pending local notification requests.
void GetPendingLocalNotifications()
{
    Notifications.GetPendingLocalNotifications(GetPendingLocalNotificationsCallback);
}

// Callback.
void GetPendingLocalNotificationsCallback(NotificationRequest[] pendingRequests)
{
    foreach (var request in pendingRequests)
    {
        NotificationContent content = request.content;           // notification content

        Debug.Log("Notification request ID: " + request.id);    // notification request ID
        Debug.Log("Notification title: " + content.title);
        Debug.Log("Notification body: " + content.body);
    }
}
```

Cancel a Pending Local Notification

To cancel a particular pending local notification, call the *CancelPendingLocalNotification* method with the request ID of the notification to be canceled. Canceled notifications will no longer be delivered.

```
// Cancels a pending local notification with known request ID.
Notifications.CancelPendingLocalNotification("REQUEST_ID_TO_CANCEL");
```

Cancel All Pending Local Notifications

To cancel all pending local notifications, simply call the *CancelAllPendingLocalNotifications* method.

```
// Cancels all pending local notifications.
Notifications.CancelAllPendingLocalNotifications();
```

Working with Remote Notifications

Remote notifications are sent from a remote server and are typically scheduled from a website, e.g. OneSignal's dashboard. Within your app, you only need to write code to handle when a remote notification is delivered and opened.

Handling Opened Notifications

Whenever a local or remote notification is opened - either by the user tapping on it (default open action) or selecting an action button - your app will be brought to foreground and then a *LocalNotificationOpened* or a *RemoteNotificationOpened* event will be raised. You can subscribe to these events and take appropriate actions according to your app design. It's recommended to subscribe to the events as soon as your app is loaded, e.g. in the *OnEnable* method of a MonoBehaviour script in your first scene. Otherwise you risk missing them.

If your app is in foreground when a notification is delivered - be it local or remote - then the notification is not posted (not displayed) and the *LocalNotificationOpened* or *RemoteNotificationOpened* event will be raised immediately as if the notification was opened with the default action.

```
// Subscribes to notification events.
void OnEnable()
{
    Notifications.LocalNotificationOpened += OnLocalNotificationOpened;
    Notifications.RemoteNotificationOpened += OnRemoteNotificationOpened;
}

// Unsubscribes notification events.
void OnDisable()
{
    Notifications.LocalNotificationOpened -= OnLocalNotificationOpened;
    Notifications.RemoteNotificationOpened -= OnRemoteNotificationOpened;
}

// This handler will be called when a local notification is opened.
void OnLocalNotificationOpened(LocalNotification delivered)
{
    // The actionId will be empty if the notification was opened with the default action.
    // Otherwise it contains the ID of the selected action button.
    if (!string.IsNullOrEmpty(delivered.actionId))
    {
        Debug.Log("Action ID: " + delivered.actionId);
    }

    // Whether the notification is delivered when the app is in foreground.
    Debug.Log("Is app in foreground: " + delivered.isAppInForeground.ToString());

    // Gets the notification content.
    NotificationContent content = delivered.content;

    // Take further actions if needed...
}

// This handler will be called when a remote notification is opened.
void OnRemoteNotificationOpened(RemoteNotification delivered)
```

```
{  
    // The actionId will be empty if the notification was opened with the default action.  
    // Otherwise it contains the ID of the selected action button.  
    if (!string.IsNullOrEmpty(delivered.actionId))  
    {  
        Debug.Log("Action ID: " + delivered.actionId);  
    }  
  
    // Whether the notification is delivered when the app is in foreground.  
    Debug.Log("Is app in foreground: " + delivered.isAppInForeground.ToString());  
  
    // Gets the notification content.  
    NotificationContent content = delivered.content;  
  
    // If OneSignal service is in used (currently it's the only push notification  
    // service supported), you can access the original OneSignal payload.  
    OneSignalNotificationPayload payload = delivered.oneSignalPayload;  
  
    // Take further actions if needed...  
}
```

Removing Delivered Notifications

Normally delivered notifications are cleared automatically when they're opened. You can manually clear all previously shown notifications of your app from the notification center or status bar with the *ClearAllDeliveredNotifications* method.

```
// Clear all delivered notifications (local and remote).  
Notifications.ClearAllDeliveredNotifications();
```

PlayMaker Actions

The PlayMaker actions of the Notifications module are group in the category *Easy Mobile - Notifications* in the PlayMaker's Action Browser.

Please refer to the NotificationsDemo_PlayMaker scene in folder
Assets/EasyMobile/Demo/PlayMakerDemo/Modules for an example on how these actions can be used.

The screenshot shows the 'Actions' window in PlayMaker. The left sidebar lists various categories: Color, Convert, Debug, Device, Easy Mobile - Advertising, Easy Mobile - Game Services, Easy Mobile - Gif, Easy Mobile - In-App Purchasing, Easy Mobile - Native APIs, and Easy Mobile - Notifications. The 'Easy Mobile - Notifications' category is currently selected, indicated by a dark grey background. Below this category, a list of actions is displayed, each preceded by a small blue square icon:

- Notification_Cancel All Pending Local Notifications
- Notification_Cancel Pending Local Notification
- Notification_Clear All Delivered Notifications
- Notification_Init
- Notification_Is Initialized
- Notification_Is Module Enabled
- Notification_On Notification Opened
- Notification_Schedule Local Notification
- Notification_Schedule Local Notification Repeat

Below the action list, there is a vertical scroll bar. Further down the window, the details for the selected action ('Notification_Cancel All Pending Local Notifications') are shown:

Notification_Cancel All Pending Local Notifications
Cancels all pending local notifications.

At the bottom of the window, there are two buttons: a checked checkbox labeled 'Preview' and a button labeled 'Add Action To State'.

Utilities

The Utilities module is a place to hold useful miscellaneous features. The first feature added to this module is Store Review.

Store Review

Ratings and reviews can have a crucial impact on the performance of an app on app stores. Therefore it's a common practice to ask users for ratings when appropriate. The Store Review feature gives you an efficient way to do that using a native and highly customizable rating dialog.

This rating dialog has different appearances and behaviors depended on the platform it is being used.

iOS 10.3 and newer

On iOS 10.3 or newer, the system-provided rating dialog is employed. This dialog is built-in to iOS since its 10.3 release, and is the preferred method to solicit user ratings on this platform.

You can find more information about this built-in rating prompt at
<https://developer.apple.com/ios/human-interface-guidelines/interaction/ratings-and-reviews/>

It's worth noting that the Submit button on this rating popup will be disabled while your app is still in sandbox mode. It will be functioning normally when the app is actually live on App Store.

iOS Before 10.3

On iOS older than 10.3, a typical 3-button alert is used as the rating prompt. This is mainly for backward-compatibility purpose, since the new built-in rating prompt is preferred and will be used on the majority of iOS devices in the near future, given the high adoption rate of new iOS versions.

Unlike the built-in dialog, you can customize the title, message and button labels of this alert to suit your needs. The default behavior of this rating prompt is described below.

- *Don't Ask Again*: close and never show this prompt again
- *Remind Me Later*: close this alert
- *Rate Now!*: open the "Write A Review" page of the current app on the App Store, the prompt will never be displayed again

Android

On Android, we built a native, custom alert that employs the RatingBar component to form the rating dialog. The picture below illustrates how this dialog looks and behaves.

The idea is to ask the user how they would rate the app, and the dialog will update itself based on the given rating. You can set a "minimum accepted rating" value, which is the lowest number of stars expected for your app. Any rating lower than this value is considered a bad rating, and vice versa. If the user is giving a good rating, we will take them to the store to do the actual rating and review. Otherwise, we will suggest them to send a feedback to your support email instead. The default behavior of this rating dialog is described below. Again, you can discard this default behavior and implement a custom one if you wish.

- *Don't Ask Again*: close and never show this prompt again
- *Not Now/Cancel*: close this prompt
- *Send Feedback*: open email client for the user to send feedback to your email address
- *Rate Now!*: open the product page of the app on the Google Play Store, the prompt will never be displayed again

On Android or iOS older than 10.3, you can discard the default behavior of the rating dialog and give your own behavior implementation if you wish.

Display Policy

It is up to you to decide when to show the rating prompt in your game to maximize its effectiveness while maintaining the best user experience. Generally, it is advisable to not annoy the user by asking repeatedly or too frequently. For that purpose, the rating request feature provides a few general constraints to help regulate the display of the rating prompt. You are free to configure these values appropriately to suit your needs. These constraints include:

- *Annual Cap*: the maximum number of requests allowed each year
- *Delay After Installation*: the required waiting time (days) since app installation before the first rating request can be made
- *Cooling-Off Period*: the minimum interval (days) required between two consecutive requests

On iOS 10.3 and newer (where the built-in rating prompt is used), the *Annual Cap* is overwritten by the OS and will always be set to 3.

For the *Delay After Installation* constraint to function properly, it is required that an instance of the EasyMobile prefab is added to the first scene of your game (so that it can record the installation timestamp).

Dialog Content and Localization

The default content (texts) of the rating dialog can be entered in the settings UI (see the **Configuration** section). This content can be altered in runtime (see the **Scripting** section), so that you can use this feature in conjunction with another localization plugin to fully localize your popup.

Configuration

You can configure the Store Review feature from the Utilities module. Go to *Window > Easy Mobile > Settings*, then select the Utilities tab to reveal it.

In the **[STORE REVIEW] REQUEST DIALOG CONFIG** section, you can customize the appearance, behavior and display constraints of the rating dialog.

- **Default Dialog Content:** the default texts of the rating dialog used on Android and iOS

older than 10.3 (on iOS 10.3 or newer this content is governed by the system)

- *Minimum Accepted Rating*: the lowest number of stars required to be considered as a good rating, you can set it to 0 to disable the feedback feature (accept all ratings); *note that this is only applicable on Android*
- *Support Email*: your email address for receiving feedback
- *iOS App Id*: your app Id on the Apple App Store, this is required to open the review page of the app on iOS older than 10.3
- *Annual Cap*: the maximum number of requests allowed each year
- *Delay After Installation*: the required waiting time (days) since app installation before the first rating request can be made
- *Cooling-Off Period*: the minimum interval (days) required between two consecutive requests
- *Ignore Constraints In Development*: ignore all display constraints so the rating popup can be shown every time in Development builds (unless it was disabled before)

Scripting

This section provides a guide to work with the Store Review API.

You can access the Store Review API via the `StoreReview` class under the `EasyMobile` namespace.

Request Rating

To show the rating dialog using its default content and retain its default behavior, use the `RequestRating` method without any parameter. Note that this method is a no-op if the rating dialog has been disabled, or one of display constraints is not satisfied. You should call this method when it makes sense in the experience flow of your app, to maximize the effectiveness of the request.

On iOS 10.3 or newer, the actual display of the rating dialog is governed by App Store policy. When your app is still in sandbox/development mode, the dialog is always displayed for testing purpose. However, it won't be shown in an app that you distribute using TestFlight.

```
// Show the rating dialog with default behavior
StoreReview.RequestRating();
```

To check if the rating dialog has been disabled (because the user selected *Don't Ask Again* or already gave a rating):

```
// Check if the rating dialog has been disabled
bool isEnabled = StoreReview.IsRatingRequestDisabled();
```

To get the number of used and remaining requests in the current year:

```
// Get the number of requests used this year
int usedRequests = StoreReview.GetThisYearUsedRequests();

// Get the number of unused requests this year
int unusedRequests = StoreReview.GetThisYearRemainingRequests();
```

To get the timestamp of the last request:

```
// Get the time when the last rating popup is shown
DateTime lastTime = StoreReview.GetLastRequestTimestamp();
```

To check if it's eligible to show the rating dialog (which means it hasn't been disabled and all display constraints are satisfied):

```
// Check if it's eligible to show the rating dialog and then show it
if (StoreReview.CanRequestRating())
{
    StoreReview.RequestRating();
}
```

Localize the Rating Dialog

To localize the content of the rating dialog, simply create a new `RatingDialogContent` to hold the translated texts (which you may obtain from a standard localization plugin), and pass it to the `RequestRating` method.

```
// Create a RatingDialogContent object to hold the translated content of the dialog
var localized = new RatingDialogContent(
    YOUR_LOCALIZED_TITLE + RatingDialogContent.PRODUCT_NAME_PLACEHOLDER,
    YOUR_LOCALIZED_MESSAGE + RatingDialogContent.PRODUCT_NAME_PLACEHOLDER + "?",
    YOUR_LOCALIZED_LOW_RATING_MESSAGE,
    YOUR_LOCALIZED_HIGH_RATING_MESSAGE,
    YOUR_LOCALIZED_POSTPONE_BUTTON_LABEL,
    YOUR_LOCALIZED_REFUSE_BUTTON_LABEL,
    YOUR_LOCALIZED_RATE_BUTTON_LABEL,
    YOUR_LOCALIZED_CANCEL_BUTTON_LABEL,
    YOUR_LOCALIZED_FEEDBACK_BUTTON_LABEL
);

// Show the rating popup with the localized texts
StoreReview.RequestRating(localized);
```

Any instance of `RatingDialogContent.PRODUCT_NAME_PLACEHOLDER` (literal value `"$PRODUCT_NAME"`) will be automatically replaced by the actual product name (given in `PlayerSettings`) by the `RequestRating` method.

Request Rating with Custom Behavior

On Android or iOS older than 10.3, you can discard the default behavior of the rating dialog and provide your own implementation to suit your needs (again, on iOS 10.3 or newer we employ the native rating prompt whose behavior is governed by the system itself). This can

be useful in cases when you want to perform additional tasks like recording the number of users who gave good ratings (maybe for analytics purpose). To do so, simply call the `RequestRating` method passing a callback in which the custom behavior is implemented. This callback takes as input an enum value representing the user action, which you can use to decide whatever action should be taken. Note that you can use the `DisableRatingRequest` method to prevent the rating dialog from being displayed in the future, if the user selects "Don't Ask Again" option. Also note that you can pass a `null` `RatingDialogContent` object to use the default content, otherwise create a new object as described in the **Localized the Rating Dialog** section above.

From the analytics point of view, it's worth noting that the rating given in the rating dialog on Android is merely *a suggestion of how the user would rate the app*. There's currently no reliable way to verify if it is the actual rating given on the app stores or not.

```
// Show rating dialog with a callback for custom behavior
// Passing null for the RatingDialogContent parameter to use the default content
StoreReview.RequestRating(null, RatingCallback);

// The rating callback
private void RatingCallback(StoreReview.UserAction action)
{
    switch (action)
    {
        case StoreReview.UserAction.Refuse:
            // Don't ask again. Disable the rating dialog
            // to prevent it from being shown in the future.
            StoreReview.DisableRatingRequest();
            break;
        case StoreReview.UserAction.Postpone:
            // User selects Not Now/Cancel button.
            // The dialog automatically closes.
            break;
        case StoreReview.UserAction.Feedback:
            // Bad rating, user opts to send feedback email.
            break;
        case StoreReview.UserAction.Rate:
            // Good rating, user wants to rate.
            break;
    }
}
```

PlayMaker Actions

The PlayMaker actions of the Utilities module are group in the category *Easy Mobile - Utilities* in the PlayMaker's Action Browser.

Please refer to the UtilitiesDemo_PlayMaker scene in folder
Assets/EasyMobile/Demo/PlayMakerDemo/Modules for an example on how these actions can be used.

Release Notes

Version 1.2.0

This a major update in which we're adding brand new features, revamping the whole API as well as fixing some known issues. We also renamed some modules and revised related wording to better present the plugin content. Most importantly, with this update we're restructuring the Easy Mobile product line. Specifically:

- The existing Easy Mobile version will now be Easy Mobile Pro, which is the highest version and contains all the available features of the plugin. Current Easy Mobile users therefore will own the Pro version automatically.
- A new version named Easy Mobile Basic will be introduced at a lower price than the Pro version. It will contain all the core features but without a few advanced ones such as GIF and Saved Games. For details about feature differences between Pro and Basic versions please see the Feature Comparison table.
- The Easy Mobile: GIF Tools version will be deprecated.

New Features

- **Game Services module:**
 - Added the brand new feature Saved Games, which allow easy synchronization of game data to cloud services including iCloud (iOS) and Google Drive (Android).
 - Allows specifying an optional the Web Client ID when setup Google Play Games.
 - New PlayMaker actions for Saved Games feature.
- **Notifications module:**
 - Added support for fully-customizable local notifications.
 - Fully compatible with Android 8.0 notification channels and channel groups.
 - New PlayMaker actions for local notifications.
- **Native APIs module:**
 - Native UI feature: added a method to check whether an alert is being displayed

Changes

- **Advertising module:**
 - Removed *IsShowingBannerAd* and *GetActiveBannerAdNetworks* methods because there's currently no reliable way to obtain this information that would work

consistently across all the supported networks

- **Scripting:**

- Introduced much of code refactoring to enhance stability, maintainability, scalability and readability.
- Renamed major classes to make the API more intuitive; specifically, each module/feature now has a main class with the same name, where its API can be accessed.
- Removed the feature that automatically disables debug logs in production builds.

- **Editor:**

- Upgraded to Google Play Services Resolver version 1.2.61.0

Bug Fixes

- **GIF module:**

- Fixed Giphy upload error "401 Unauthorized".
-

Version 1.1.5p2

New Features

- **Advertising module:**

- AdManager class now exposes a RewardedAdSkipped event, which is raised when a rewarded ad was closed before finishing.

Bug Fixes

- **Editor:**

- Replaced the old Chartboost SDK download URL with a new working one.
-

Version 1.1.5p1

Bug Fixes

- **PlayMaker Actions:**

- Fixed a minor error in the script for MobileNativeShare_CaptureScreenshot action.
-

Version 1.1.5

New Features

- **Editor:**
 - Incorporated the [Google Play Services Resolver for Unity](#) plugin for Android dependencies management.
 - Added the **Import Play Services Resolver** item to Easy Mobile menu for manual import of this resolver if needed (normally it will be imported automatically upon importing Easy Mobile)

Changes

- **Editor:**
 - Easy Mobile's native code is now statically included in folder Assets/EasyMobile/Plugins folder, rather than being imported automatically from script into Assets/Plugins folder as before. This enhances the plugin's robustness as it prevents build errors due to unintended removal of plugin files in the Assets/Plugins folder.
 - Removed the **Reimport Native Package** item from Easy Mobile menu (as a result of the above change).

Bug Fixes

- **Native Sharing module:**
 - Fixed a bug causing image sharing to fail on Android 7 (Nougat) and above. Image sharing on these platforms now uses FileProvider to comply with the new Android security requirements.

Notes

* Since the plugin structure changes quite a lot in this version, you need to do some cleanup before importing the new plugin. Please see the **Upgrade Guide** section for more details.

Version 1.1.4b

Changes

- **GIF module:**
 - Optimized memory usage when exporting GIF.
-

Version 1.1.4a

Bug Fixes

- **In-App Purchasing module:**
 - Updated editor scripts to be compatible with UnityIAP version 1.14.0.

Notes

* If you're upgrading Easy Mobile from an existing project that uses IAP module, you need to upgrade (re-import) UnityIAP package too. Please see the **Upgrade Guide** section for more details.

Version 1.1.4

New Features

- **Game Service module:**
 - Added a new method to show the UI of a specific leaderboard in an (optional) time scope.
- **In-App Purchasing module:**
 - Added a new method to get all IAP products created in the module settings.
- **Utilities module - Rating Request feature:**
 - Added new display constraints: delay after installation & cooling-off period.
 - Added an option to ignore display constraints while in development mode.
 - Added new methods to get the timestamp of the last request, the number of requests used in the current year, etc.
 - Added the ability to update the dialog content in runtime for localization purposes (see the user guide for details).
- **Editor:**

- [Android] leaderboard & achievement IDs are now sorted alphabetically in the settings UI.
- We've now got a little cute About window where you can quickly find out the version of your Easy Mobile :)

Changes

- **Game Service module:**
 - *UserAuthenticated* event is now officially removed.
-

Version 1.1.3

New Features

- **Introducing brand new PlayMaker actions!**
 - Easy Mobile is now compatible with PlayMaker, starting with nearly 100 custom actions covering all modules!
- **Utilities module:**
 - Added new method GetAnnualRequestLimit to get the annual cap of the rating request popup from script

Changes

- **Game Service module:**
 - Added optional callback to ReportScore, RevealAchievement, UnlockAchievement & ReportAchievementProgress to acknowledge if the operation succeeds or not

Bug Fixes

- **Editor:**
 - Fixed a bug on Unity 5.6+ causing EasyMobile prefab instance to not be detected properly if the containing scene is not active -> a false "**Easy Mobile Instance Not Found**" alert is shown before building
-

Version 1.1.2

Changes

- **In-App Purchasing module:**
 - Updated the receipt validation method to handle cases when the input receipt is null or empty.
-

Version 1.1.1

New Features

- **In-App Purchasing module:**
 - Added new methods to read receipts from Apple stores and Google Play store
 - Added a new method to refresh Apple App Receipt
-

Version 1.1.0

This is a major release with many new features and improvements!

New Features

- **Introducing brand new module GIF!**
 - Low overhead screen/camera recorder
 - Built-in players for playback of recorded clips
 - High performance, mobile-friendly GIF image generator
 - Giphy upload API for sharing GIF images to social networks
 - **Native Sharing module:**
 - Added *ShareText* and *ShareURL* methods to *MobileNativeShare* class
 - **Editor:**
 - Added a new context menu for creating EasyMobile instance and other built-in objects in the Hierarchy window
 - Added new item **Reimport Native Package** to Easy Mobile menu
 - [Unity 5.6+] Added a warning popup which is shown when an iOS or Android build starts while no EasyMobile instance was added to any scene
-

Version 1.0.4

New Features

- **Game Service module:**
 - Added *SignOut* method to *GameServiceManager* class.
-

Version 1.0.3

This update introduces important improvements and bug fixes.

New Features

- **Advertising module:**
 - AdMob rewarded ad is now supported
 - Added support for new ad network: **AdColony**

Changes

- **Advertising module:**
 - Ad events are now raised from main thread when using AdMob
 - *RewardedAdCompleted* event is now raised after the ad is closed, to ensure a consistent behavior across different ad networks

Bug Fixes

- **Native Sharing module:**
 - Fixed a potential memory leak issue caused by the *SaveScreenshot* method of the *MobileNativeShare* class
-

Version 1.0.2

New Features

- **Introducing whole new module Utilities:**
 - The first feature of this module is **Rating Request**, an effective way to ask for rating using a native and highly customizable "rate my app" popup.
 - **Game Service module:**
 - Updated *GameServiceManager* class, introducing new events *UserLoginSucceeded* and *UserLoginFailed*; *_UserAuthenticated _event* is now obsolete.
-

Version 1.0.1

Changes

- **Game Service module:**
 - Updated scripts to be compatible with version 0.9.37 of the Google Play Games plugin for Unity.
-

Version 1.0.0

First release.

Upgrade Guide

This section describes the required actions you may need to take when upgrading to a certain version. Please visit this place before upgrading Easy Mobile to avoid unnecessary issues.

Upgrading to version 1.2.0

Version 1.2.0 is a major update in which Easy Mobile has been renamed to Easy Mobile Pro and lots of improvements and modifications were introduced, most notably API changes. If you're upgrading from an older version to 1.2.0, we strongly recommend removing the old version completely before importing the new one to avoid potential issues. Please follow these steps:

- Backup the Assets/EasyMobile/Resources and Assets/EasyMobile/Generated folders and save them somewhere safe.
 - Remove the whole Assets/EasyMobile folder.
 - Remove the file/folder named com.sgilb.easymobile.easy-mobile-1.0.2 in folder Assets/Plugins/Android.
 - Import Easy Mobile Pro 1.2.0.
 - Copy the backed up Resources and Generated folders back to Assets/EasyMobile folders.
 - Go to menu Assets > Play Services Resolver > Android Resolver > Force Resolve.
 - If you're using Game Services module on Android, run Setup Google Play Games once again in the settings UI.
 - Optionally update your scripts to fix warnings due to old classes being deprecated (they still function normally, we're just introducing new classes with different names to make the API more intuitive).
-

Upgrading to version 1.1.5 or newer

Since version 1.1.5, Easy Mobile incorporates the Google Play Services Resolver for Unity plugin for Android dependencies management, as well as moves all native code into the Assets/EasyMobile/Plugins folder. If you're upgrading from an older version to version 1.1.5 or newer, please remove the following files before importing the new package to avoid potential issues:

- Assets/Plugins/Android/easy-mobile.aar.
 - Assets/Plugins/Android/libs/armeabi-v7a/libeasymobile.so
 - Assets/Plugins/Android/libs/x86/libeasymobile.so
 - Assets/Plugins/iOS/libEasyMobile.a
-

Upgrading to version 1.1.4a or newer

Since version 1.14.0, the UnityIAP package has made changes to its API that cause some conflicts with Easy Mobile editor scripts. We addressed this problem in version 1.1.4a. If you're upgrading from an older version to 1.1.4a, and your project uses the In-App Purchasing module, you need to upgrade (re-import) the UnityIAP package to version 1.14.0 or newer to avoid incompatibility issues.

Upgrading to version 1.1.0 or newer

If you're upgrading from an older version to version 1.1.0 or newer, you'll need to:

1. Remove the EasyMobile/Demo folder
2. Remove the EasyMobile/Script folder
3. Import the new version
